Ficha técnica

Nombre de la publicación	Estimaciones y Proyecciones Nacionales de Población 1950-2100.
Objetivo general	Documentar y sistematizar la metodología empleada para la elaboración de las Estimaciones y Proyecciones Nacionales de Población de la República Dominicana, incluyendo la reconstrucción histórica del período 1950–2022 y la proyección de los componentes demográficos hasta el año 2100.
Descripción general	Presenta la metodología utilizada para la elaboración de las Estimaciones y Proyecciones Nacionales de Población de la República Dominicana, así como los principales indicadores y resultados derivados de este ejercicio. Describe las fuentes de información utilizadas, los procedimientos metodológicos aplicados y los supuestos adoptados para la reconstrucción histórica de la población y la proyección de sus componentes demográficos hasta el año 2100.
Inicio del producto estadístico	2026
Tipo de levantamiento	No aplica.
Periodicidad de la información	No aplica.
Cobertura geográfica	Nacional.
Fuente	Censos Nacionales de Población y Vivienda, Sistema de Estadísticas Vitales, Encuestas Demográficas y de Salud (ENDESA), Encuestas Nacionales de Hogares de Propósitos Múltiples (ENHOGAR), Registros administrativos y otras fuentes demográficas complementarias.
Fecha de la publicación	Agosto, 2026.
Medios para la difusión	Publicación digital a través de la página Web de la ONE.
Contactos	Mildred Martínez Directora General de la Oficina Nacional de Estadística Tel. 809-682-7777, ext. 2101 Correo: mildred.martinez@one.gob.do Paola Rodríguez Directora Interina de Estadísticas Demográficas, Sociales y Ambientales Tel. 809-682-7777, ext. 3719 Correo: paola.rodriguez@one.gob.do Kisoris Sánchez Encargada Interina del Departamento de Estadísticas Demográficas y Sociales Tel. 809 682-7777, ext. 3827 Correo: kisoris.sanchez@one.gob.do

Presentación

La Oficina Nacional de Estadística (ONE) tiene el honor de presentar la publicación Estimaciones y Proyecciones Nacionales de Población de la República Dominicana, 1950–2100, resultado de un amplio proceso de investigación, integración y análisis de la dinámica demográfica del país. Este documento constituye la referencia oficial sobre la evolución histórica y futura de la población dominicana y pone a disposición del país un insumo estratégico para fortalecer la planificación del desarrollo y la formulación de políticas públicas sustentadas en evidencia estadística.

Las estimaciones y proyecciones de población representan uno de los principales productos del Sistema Estadístico Nacional, al proporcionar información sobre el volumen, la composición y la evolución de la población en el tiempo. Sin embargo, su valor trasciende la cuantificación del número de habitantes. Constituyen un instrumento de inteligencia demográfica, al permitir comprender cómo cambian las estructuras poblacionales, anticipar escenarios futuros y orientar la toma de decisiones en sectores como la educación, la salud, el empleo, la vivienda, la protección social, la infraestructura, el ordenamiento territorial y el desarrollo sostenible.

La presente publicación reconstruye la evolución demográfica de la República Dominicana para el período 1950–2022 y presenta las proyecciones nacionales de población para el período 2023–2100, elaboradas mediante la aplicación del método de los componentes por cohorte. Para ello, integra el análisis de la fecundidad, la mortalidad y la migración internacional, sustentándose en la evaluación y conciliación de la información proveniente de los censos nacionales de población y vivienda, las estadísticas vitales, las encuestas demográficas, los registros administrativos y otras fuentes nacionales e internacionales.

Los resultados permiten comprender las profundas transformaciones demográficas experimentadas por el país durante las últimas siete décadas y ofrecen una visión prospectiva de los cambios que configurarán la estructura de la población durante el resto del siglo XXI. Más allá del crecimiento demográfico, la publicación pone de relieve procesos como la reducción sostenida de la fecundidad, el aumento de la esperanza de vida, el envejecimiento poblacional y la reconfiguración de la estructura por edad, fenómenos que redefinen las necesidades de la sociedad y representan uno de los principales desafíos para la planificación del desarrollo.

La elaboración de esta publicación ha sido posible gracias al compromiso y la dedicación del equipo técnico de la Dirección de Estadísticas Demográficas, Sociales y Ambientales de la Oficina Nacional de Estadística, quienes desarrollaron el proceso de integración, evaluación y análisis de la información, así como la aplicación de metodologías especializadas que garantizan la consistencia, calidad y transparencia de los resultados.

Expresamos nuestro sincero agradecimiento a las instituciones nacionales proveedoras de información, entre ellas el Ministerio de Educación, el Ministerio de Salud Pública y el Registro del Estado Civil de la Junta Central Electoral, cuyo compromiso con la producción y suministro de datos hizo posible este ejercicio estadístico. Asimismo, reconocemos el valioso acompañamiento técnico del Centro Latinoamericano y Caribeño de Demografía (CELADE) – División de Población de la CEPAL, bajo la dirección de Simone Cecchini, cuya cooperación y experiencia han contribuido al fortalecimiento de las capacidades nacionales para la elaboración de estimaciones y proyecciones de población.

La Oficina Nacional de Estadística pone esta publicación a disposición de las instituciones públicas, los gobiernos locales, la academia, los organismos internacionales, los centros de investigación, el sector privado y la ciudadanía en general, con la convicción de que constituirá un instrumento de referencia para comprender la dinámica demográfica del país y fortalecer la planificación basada en evidencia.

Con esta publicación, la ONE reafirma su compromiso con la producción y difusión de estadísticas oficiales de calidad, elaboradas con rigor técnico, transparencia y apego a los estándares internacionales. Asimismo, fortalece la generación de inteligencia demográfica al servicio del Estado y de la sociedad, promoviendo el uso estratégico de la información para

Directora General

Introducción

Las estimaciones y proyecciones de población constituyen uno de los principales instrumentos para comprender la evolución demográfica de un país y anticipar los cambios que experimentará su población en el tiempo. Al integrar el comportamiento de la fecundidad, la mortalidad y la migración, permiten conocer la dinámica del crecimiento poblacional, la transformación de la estructura por sexo y edad, así como los procesos asociados al envejecimiento de la población y a la transición demográfica.

La disponibilidad de estimaciones y proyecciones actualizadas representa un insumo fundamental para la planificación del desarrollo, la formulación, seguimiento y evaluación de políticas públicas, así como para la producción de indicadores oficiales y el monitoreo de los compromisos nacionales e internacionales. En un contexto de transformaciones demográficas cada vez más aceleradas, estos ejercicios fortalecen la inteligencia demográfica del país al generar evidencia para anticipar escenarios futuros y contribuir al desarrollo de una mayor resiliencia demográfica, entendida como la capacidad de las instituciones para adaptarse de manera oportuna a los cambios en la estructura y dinámica de la población.

La presente publicación pone a disposición las Estimaciones y Proyecciones Nacionales de Población de la República Dominicana para el período 1950–2100, elaboradas por la Oficina Nacional de Estadística (ONE) mediante la aplicación del método de los componentes por cohorte, incorporando las recomendaciones metodológicas internacionales más recientes y el acompañamiento técnico del Centro Latinoamericano y Caribeño de Demografía (CELADE) – División de Población de la CEPAL.

El documento presenta la metodología utilizada para la reconstrucción histórica de la población correspondiente al período 1950–2022 y para la elaboración de las proyecciones nacionales del período 2023–2100. Como parte de este proceso, se adoptó un esquema anual por edades simples, sustituyendo el enfoque tradicional basado en grupos quinquenales de edad y años terminados en cero y cinco. Esta actualización metodológica permite disponer de estimaciones más detalladas, comparables y consistentes con los requerimientos actuales del análisis demográfico y de la planificación nacional.

Las estimaciones revisadas constituyen la base demográfica sobre la cual se desarrollan las proyecciones de población. Los resultados se presentan por sexo y edad al 30 de junio de cada año e incorporan los principales componentes del cambio demográfico: la fecundidad, la mortalidad y la migración internacional, permitiendo analizar la evolución histórica de la población dominicana y anticipar su comportamiento durante el resto del siglo XXI.

La adopción de esta metodología fortalece la capacidad de la Oficina Nacional de Estadística para actualizar periódicamente las estimaciones y proyecciones de población, incorporando oportunamente la información proveniente de nuevas fuentes demográficas y revisando, cuando sea necesario, los supuestos asociados a cada uno de los componentes del cambio poblacional. De esta manera, se garantiza la disponibilidad de un marco demográfico oficial consistente, transparente y alineado con las mejores prácticas internacionales, consolidando una base de conocimiento que fortalece la inteligencia y la resiliencia demográficas del país frente a los desafíos presentes y futuros.

La publicación se estructura en ocho capítulos. En ellos se presentan el contexto demográfico nacional, las fuentes de información utilizadas, la metodología general de estimación y proyección, los procedimientos aplicados para la estimación de los componentes demográficos, la definición de la población base y los supuestos adoptados, los principales resultados obtenidos, el alcance y utilización de las estimaciones y proyecciones, así como las conclusiones del ejercicio. El documento se complementa con la bibliografía, un glosario de términos y los anexos metodológicos y estadísticos que respaldan el proceso de elaboración.

La Oficina Nacional de Estadística pone esta publicación a disposición de las instituciones públicas, la academia, los organismos internacionales, el sector privado y la ciudadanía en general, con el propósito de fortalecer el conocimiento sobre la dinámica demográfica del país y contribuir a la formulación de políticas públicas y a la toma de decisiones sustentadas en evidencia estadística.

Contexto demográfico nacional

1. Contexto demográfico nacional

1.1 Evolución de la dinámica demográfica y transformación de la estructura por edad, 1950–2022

La dinámica demográfica constituye uno de los principales determinantes del desarrollo sostenible, al influir directamente sobre la demanda de bienes y servicios, la organización territorial, los sistemas de salud y protección social, el mercado laboral, la infraestructura y la sostenibilidad de las políticas públicas. En este contexto, comprender cómo evoluciona la población y anticipar sus transformaciones representa hoy un ejercicio de inteligencia demográfica, entendida como la capacidad de transformar la evidencia estadística en conocimiento para orientar la planificación y fortalecer la toma de decisiones.

En la República Dominicana, la evolución de la población durante las últimas siete décadas refleja un profundo proceso de transformación estructural asociado al avance de la transición demográfica. Los cambios observados en la fecundidad, la mortalidad y la migración modificaron progresivamente el ritmo de crecimiento poblacional, la estructura por edad y sexo y la distribución de la población, configurando un nuevo escenario demográfico con importantes implicaciones para el desarrollo económico, social y ambiental del país.

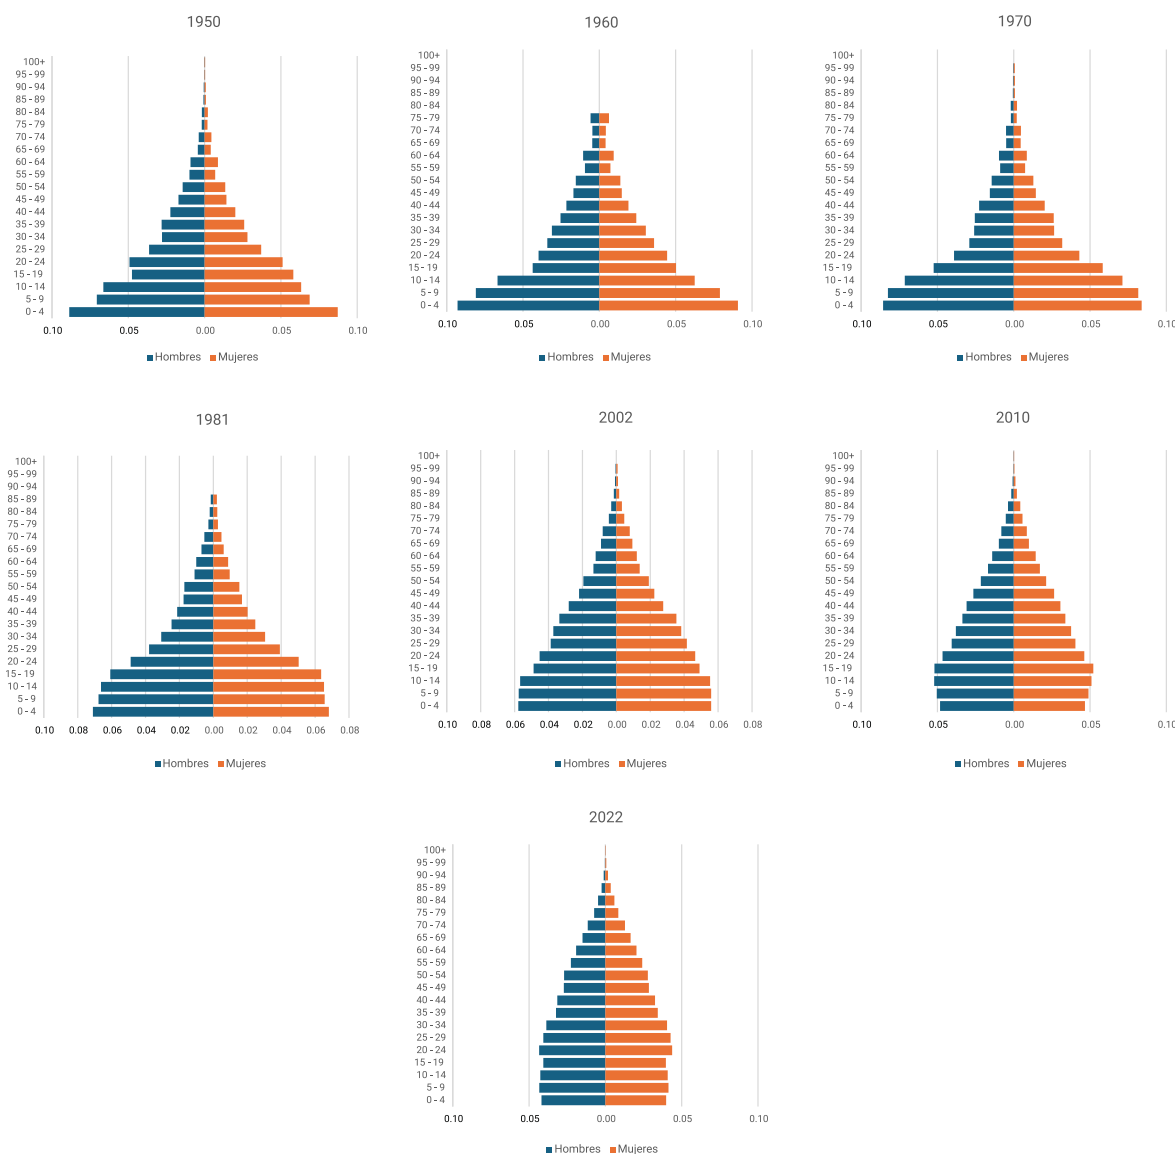

Durante este período, la población residente pasó de poco más de dos millones de habitantes en 1950 a superar los diez millones en 2022, multiplicándose por más de cinco en poco más de siete décadas. Este crecimiento respondió inicialmente a la combinación de elevados niveles de fecundidad y una rápida reducción de la mortalidad, características propias de las primeras etapas de la transición demográfica. Posteriormente, el descenso sostenido de la fecundidad dio lugar a una desaceleración del crecimiento natural y al inicio de una etapa de crecimiento demográfico más moderado.

Uno de los cambios más significativos se observa en la evolución de la estructura por edad de la población. La comparación de las pirámides de población evidencia el tránsito desde una estructura predominantemente joven y expansiva hacia otra más madura, caracterizada por una reducción del peso relativo de la población infantil, una mayor concentración de personas en edades potencialmente activas y un incremento sostenido de la población adulta mayor. Este proceso refleja el avance del envejecimiento poblacional y la redefinición de las relaciones de dependencia entre generaciones.

Estas transformaciones no solo modifican la composición de la población, sino también la naturaleza de las demandas que enfrentará el país en las próximas décadas. La disminución de la fecundidad, el aumento de la longevidad y los cambios en la estructura de los hogares plantean nuevos desafíos para los sistemas de salud, educación, cuidados, protección social, empleo y ordenamiento territorial. Al mismo tiempo, generan oportunidades para fortalecer el desarrollo humano y aprovechar las ventajas derivadas de una adecuada planificación basada en evidencia.

En este contexto, disponer de estimaciones demográficas consistentes y actualizadas constituye un elemento fundamental para interpretar la evolución reciente de la población dominicana y establecer una base sólida para la elaboración de las nuevas estimaciones y proyecciones nacionales de población. Estas permiten integrar la información proveniente de diversas fuentes estadísticas y ofrecer un marco demográfico coherente que respalde la producción de indicadores oficiales y la planificación basada en evidencia.

Figura 1. REPÚBLICA DOMINICANA: Estructuras por sexo y edad de la población, en los censos nacionales 1950 -2022

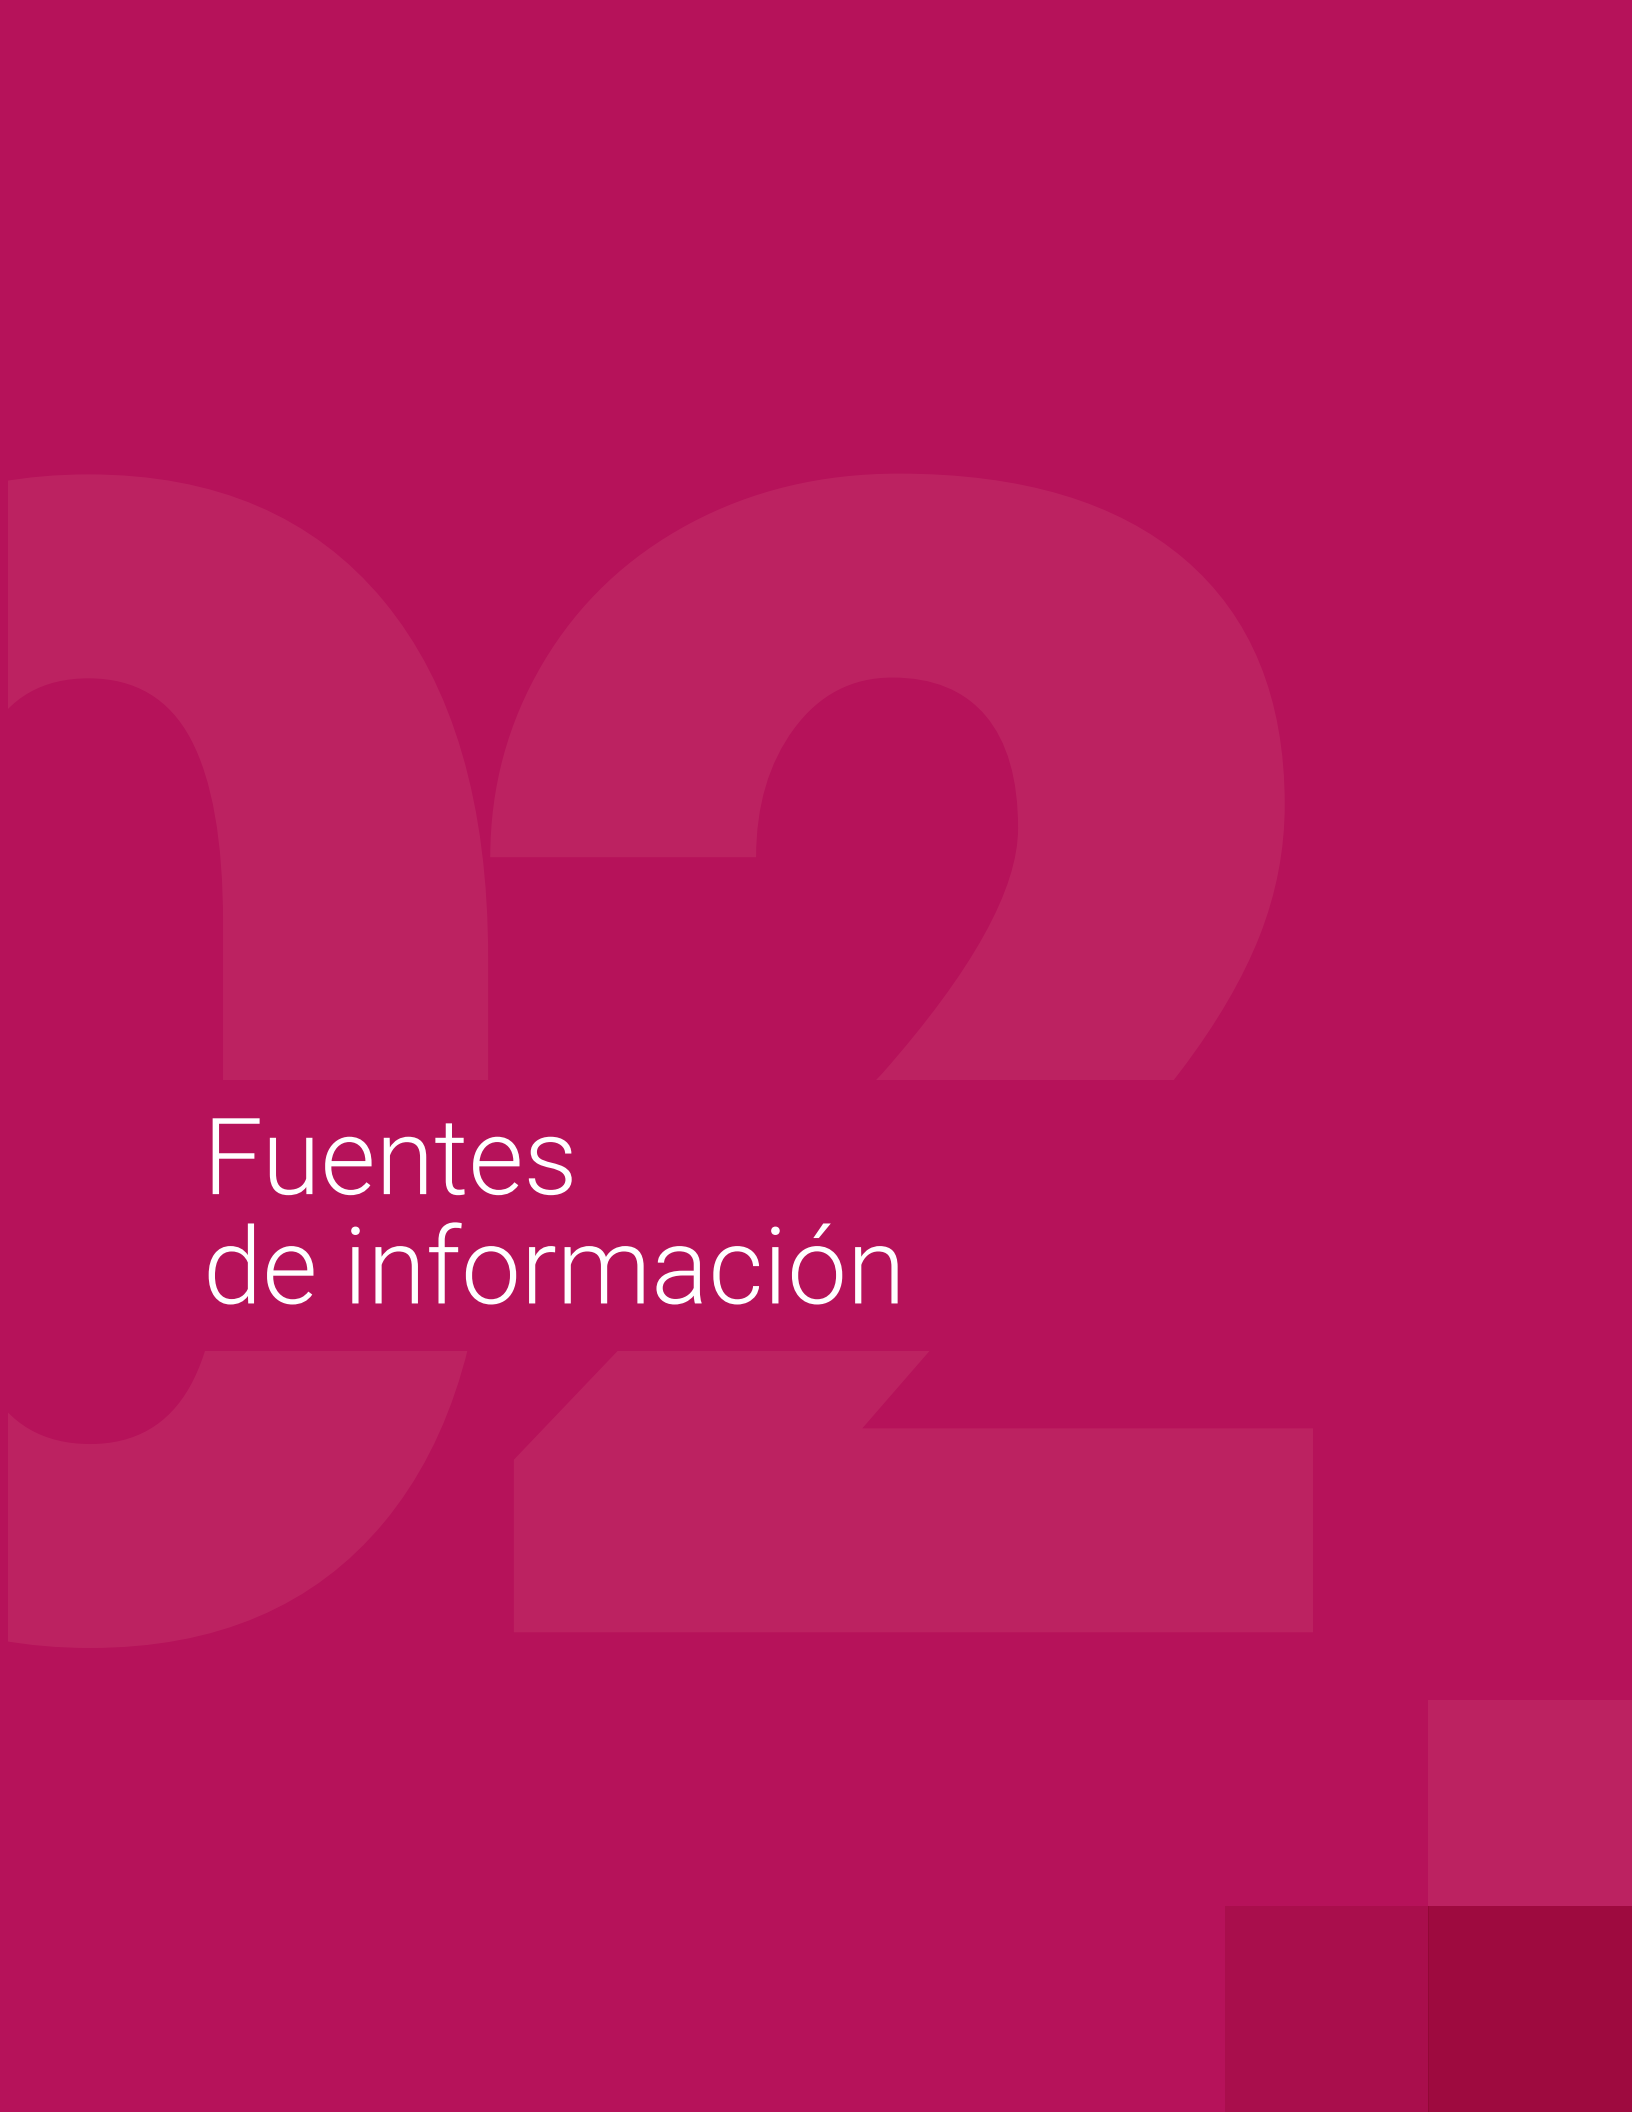

La comparación de las pirámides de población correspondientes a los censos nacionales permite visualizar con claridad la magnitud de esta transformación (Figura 1). La pirámide de 1950 presenta una base amplia y una rápida reducción de efectivos hacia las edades superiores, reflejando los elevados niveles de fecundidad y una menor supervivencia de la población. En contraste, la pirámide correspondiente al X Censo Nacional de Población y Vivienda 2022 muestra una estructura más equilibrada, con una base relativamente más estrecha y una mayor concentración de población en edades adultas y avanzadas.

A partir del censo de 1970 comienzan a observarse los primeros cambios en la estructura etaria asociados al descenso de la fecundidad. El progresivo estrechamiento de la base de la pirámide refleja la reducción del número relativo de nacimientos, mientras que el aumento sostenido de la esperanza de vida favorece una mayor permanencia de la población en edades adultas y un crecimiento gradual de las personas de 65 años y más. Esta evolución evidencia el tránsito hacia una estructura poblacional más madura, en la que disminuye la proporción de niños y adolescentes y aumenta la participación relativa de la población adulta y adulta mayor.

Más allá del crecimiento del volumen de población, las pirámides censales ponen de manifiesto un cambio estructural de la población, caracterizado por la redistribución progresiva de los efectivos hacia edades cada vez más avanzadas. Como consecuencia, se modifican las relaciones de dependencia demográfica y emergen nuevas demandas para los sistemas de educación, salud, empleo, protección social y cuidados, así como para la planificación territorial y el desarrollo sostenible.

Desde la perspectiva de la inteligencia demográfica, estos cambios evidencian que comprender la evolución de la estructura por edad resulta tan importante como conocer el tamaño de la población. La composición etaria condiciona las necesidades presentes y futuras de la sociedad y constituye un elemento esencial para orientar la formulación de políticas públicas, la asignación eficiente de recursos y la planificación del desarrollo.

La evolución observada hasta 2022 constituye el punto de partida para la actualización de las Estimaciones y Proyecciones Nacionales de Población, al proporcionar el marco demográfico de referencia sobre el cual se sustentan los análisis y procedimientos metodológicos desarrollados en los capítulos siguientes.

Fuentes de información

2. Fuentes de información

2.1 Censos nacionales de población y vivienda

Los censos nacionales de población y vivienda constituyen la principal fuente para determinar el volumen, la distribución territorial y la estructura por sexo y edad de la población. Asimismo, proporcionan la población base para la elaboración de las estimaciones y proyecciones nacionales y permiten analizar la evolución de la estructura demográfica del país a lo largo del tiempo.

En este ejercicio se utilizaron los resultados definitivos de los censos nacionales correspondientes a los años 1950, 1960, 1970, 1981, 1993, 2002, 2010 y 2022, los cuales constituyen el principal marco de referencia para la reconstrucción de la evolución demográfica de la República Dominicana.

2.2 Encuestas demográficas y de hogares

Las encuestas especializadas complementan la información censal al proporcionar indicadores relacionados con la fecundidad, la mortalidad, la migración y otras características sociodemográficas de la población. Estas investigaciones permiten analizar tendencias recientes y evaluar la consistencia de las estimaciones obtenidas mediante otras fuentes.

Para la elaboración de este documento se utilizaron:

- Las Encuestas Nacionales de Fecundidad (ENF) de 1975 y 1980.
- Las Encuestas Demográficas y de Salud (ENDESA), realizadas desde 1986.
- Las Encuestas Nacionales de Hogares de Propósitos Múltiples (ENHOGAR) correspondientes a los años 2005, 2006, 2009–2010, 2014 y 2018.
- Las Encuestas Nacionales de Inmigrantes (ENI) de 2012 y 2017, utilizadas como fuente de información para el análisis de la inmigración y la caracterización de la población inmigrante residente en el país.

En conjunto, estas encuestas constituyen una fuente fundamental para la evaluación de los niveles y tendencias recientes de los principales componentes del cambio demográfico.

2.3 Registros Administrativos

Los registros administrativos constituyen una fuente continua de información para el seguimiento de la dinámica demográfica y permiten complementar la información proveniente de los censos y las encuestas. Su utilización resulta especialmente importante para el análisis de los hechos vitales y de la movilidad internacional.

En este ejercicio se emplearon las siguientes fuentes:

2.3.1 Estadísticas vitales

Se utilizaron los registros de nacimientos y defunciones desagregados por sexo y edad disponibles hasta el año 2025. Esta información permitió analizar la evolución reciente de la fecundidad y la mortalidad, así como complementar la información censal mediante procedimientos de evaluación y ajuste demográfico.

2.3.2 Registros migratorios nacionales

Para el análisis de la migración internacional se utilizaron los registros de entradas y salidas de nacionales y extranjeros suministrados por la Dirección General de Migración, así como la información sobre movilidad internacional generada por el Banco Central de la República Dominicana. Estas fuentes permitieron fortalecer la estimación de los flujos migratorios recientes y complementar la información obtenida mediante las encuestas especializadas.

2.4 Fuentes estadísticas internacionales

Dada la complejidad de la medición de la emigración internacional, fue necesario incorporar información proveniente de registros y sistemas estadísticos de otros países que permitieran estimar el volumen y la evolución de la población dominicana residente en el exterior.

Entre las principales fuentes utilizadas se encuentran:

- El Padrón Continuo de España, empleado para estimar la población nacida en la República Dominicana residente en ese país.
- La información del U.S. Census Bureau y de la American Community Survey (ACS), utilizada para analizar la población nacida en la República Dominicana residente en los Estados Unidos.

Estas fuentes permitieron complementar la información nacional y fortalecer las estimaciones del componente migratorio

2.5 Otras fuentes complementarias

Como parte del proceso de evaluación de la consistencia de las estimaciones, también se analizaron diversas estadísticas sectoriales generadas de forma continua por instituciones nacionales, entre ellas las relacionadas con matrícula escolar, programas de vacunación, construcción de viviendas, consumo de agua potable, energía eléctrica y otros registros administrativos.

Aunque estas fuentes no proporcionan estimaciones directas de población, constituyen referencias valiosas para verificar la coherencia de las tendencias demográficas observadas y respaldar la validación de las estimaciones y proyecciones nacionales.

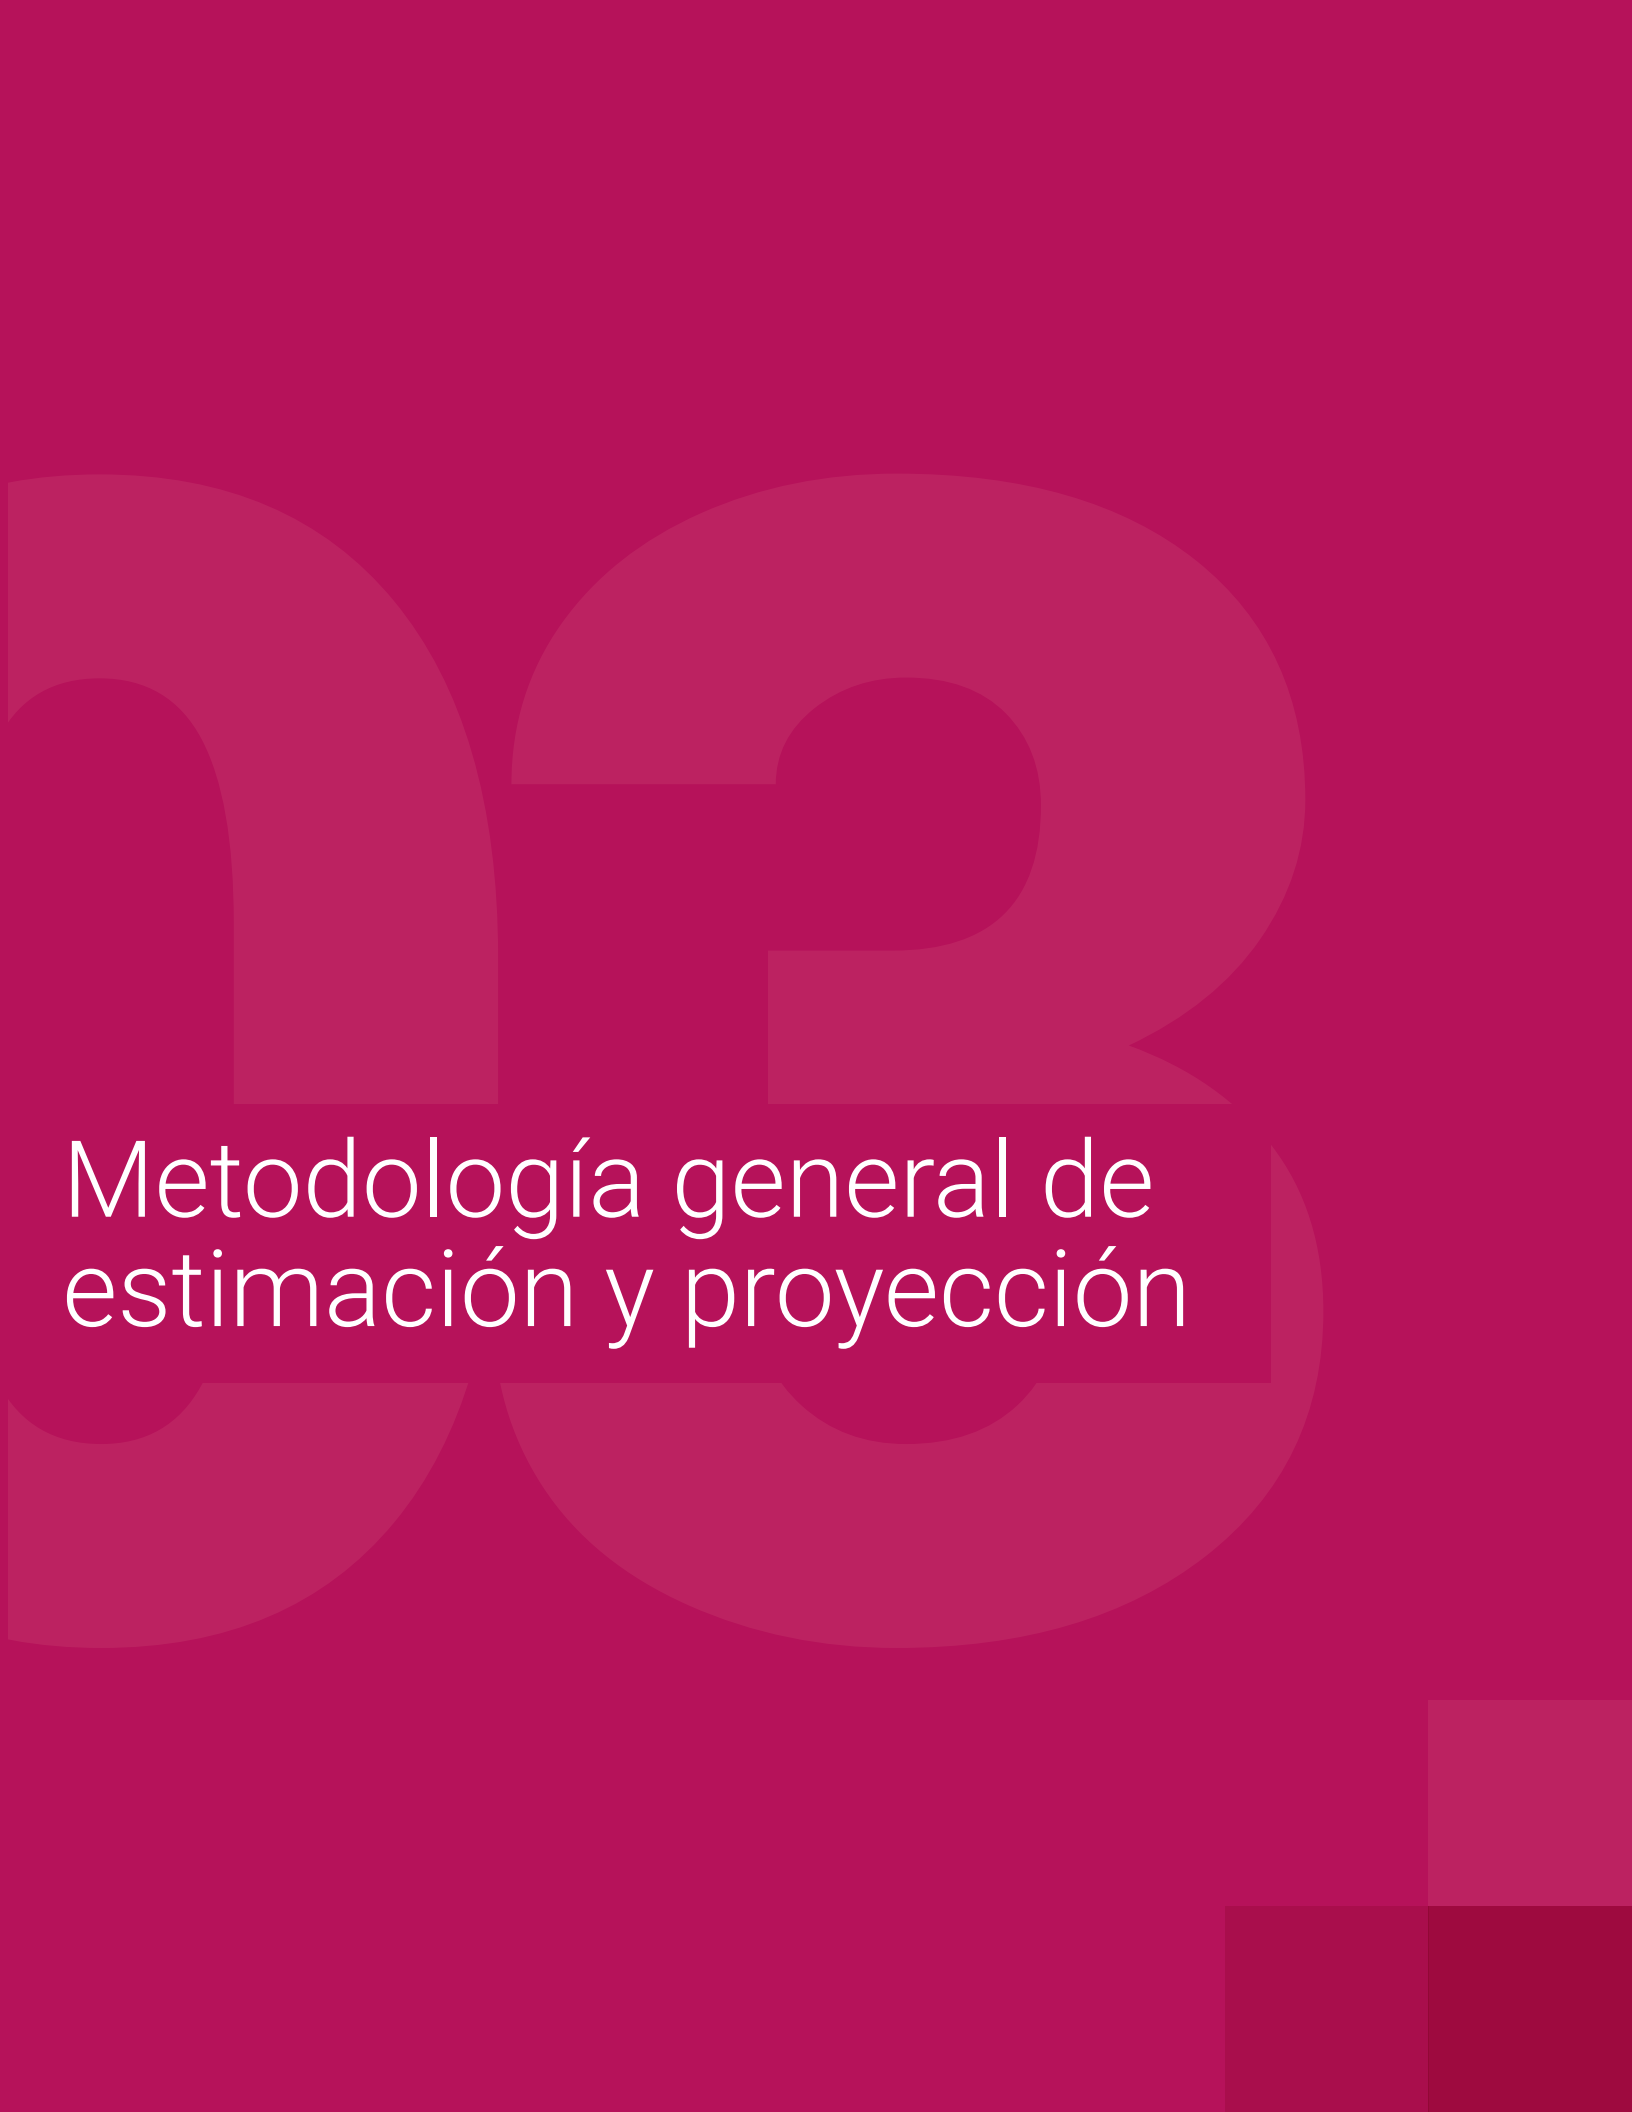

2.6 Integración y evaluación de la información

La elaboración de las Estimaciones y Proyecciones Nacionales de Población de la República Dominicana requirió la integración de diversas fuentes de información demográfica y estadística, cada una con características, alcances y niveles de desagregación particulares. Ninguna fuente, por sí sola, permite describir de manera completa la dinámica de la población; por ello, fue necesario combinar la información proveniente de censos, encuestas, registros administrativos y otras fuentes complementarias, aplicando procedimientos de evaluación, conciliación y validación que garantizaran la consistencia de las estimaciones y proyecciones.

Este enfoque permitió aprovechar las fortalezas de cada fuente y reducir las limitaciones inherentes a la información demográfica, garantizando un marco metodológico sólido para la reconstrucción histórica de la población y la elaboración de las proyecciones nacionales. El conjunto de la información recopilada permitió establecer una base estadística robusta, proporcionando los elementos necesarios para formular las hipótesis de evolución de la fecundidad, la mortalidad y la migración internacional que sustentan las proyecciones hasta el año 2100.

Cuadro 1. REPÚBLICA DOMINICANA: Resumen de las principales fuentes y utilización

Fuente	Período	Variable principal	Uso en las proyecciones
Censos	1950–2022	Tamaño y estructura población	Población base, conciliación censal, estimación fecundidad, mortalidad, inmigración internacional
Registros sobre estadísticas vitales	Anual	Nacimientos y defunciones	Estimación de fecundidad y mortalidad
Encuestas Demográficas y de Salud	1986–2013	Fecundidad y salud	Evaluación de niveles y tendencias
Encuestas Nacionales de Fecundidad (ENF)	2005–2018	Características sociodemográficas	Validación de indicadores
Encuesta Nacional de Inmigrantes (ENI)	2012 y 2017	Migración internacional	Estimación de saldos migratorios
Registros migratorios	Continuos	Entradas y salidas	Ajuste de los flujos migratorios
American Community Survey (ACS) y U.S. Census Bureau	Continuos	Emigración hacia EE. UU.	Estimación de población emigrante
Padrón Continuo de España	Continuo	Residentes en España	Estimación de emigración hacia España

Metodología general de estimación y proyección

3. Método de proyección

3.1 Método de proyección

Las estimaciones y proyecciones de población constituyen un ejercicio demográfico orientado a reconstruir la evolución de la población y anticipar su comportamiento futuro a partir del análisis de los componentes del cambio demográfico: la fecundidad, la mortalidad y la migración internacional. Su elaboración requiere evaluar las tendencias observadas, definir supuestos sobre la evolución de cada componente y aplicar procedimientos metodológicos que garanticen la coherencia entre la población estimada y proyectada.

Las proyecciones nacionales de población de la República Dominicana se fundamentan en el análisis de la evolución reciente de la dinámica demográfica, considerando los cambios observados en los niveles y patrones de fecundidad, mortalidad y migración, así como las transformaciones sociales, económicas e institucionales que pueden influir en su comportamiento futuro. Este proceso permite formular hipótesis demográficamente plausibles y consistentes con la evidencia estadística disponible.

La teoría de la transición demográfica proporciona el marco conceptual para comprender la evolución de estos componentes. No obstante, las trayectorias demográficas responden a las características particulares de cada país. En consecuencia, la formulación de los supuestos incorpora tanto la experiencia histórica de la República Dominicana como el análisis de factores asociados a las transformaciones sociales y económicas, entre ellos el incremento del uso de métodos anticonceptivos, el retraso de la maternidad y de la formación de las uniones, el aumento de la participación de la mujer en la educación superior y en el mercado laboral, así como los cambios en los patrones migratorios y en la supervivencia de la población.

Las proyecciones no constituyen una predicción exacta del futuro, sino una representación consistente de la evolución esperada de la población bajo un conjunto explícito de supuestos demográficos. Por ello, los resultados están sujetos a la incertidumbre inherente a la ocurrencia de acontecimientos extraordinarios que no pueden anticiparse con precisión. Un ejemplo reciente fue la pandemia de COVID-19, que produjo un incremento temporal de la mortalidad y modificó las tendencias demográficas observadas en numerosos países, haciendo necesaria la revisión de las estimaciones y de los supuestos de mortalidad utilizados en las proyecciones.

Asimismo, las estimaciones y proyecciones de la población contribuyen a incrementar la resiliencia demográfica del país, al facilitar la adaptación de las políticas públicas frente a los cambios en la estructura y dinámica de la población y ante eventos inesperados que puedan alterar su evolución.

3.2 Enfoque basado en el método de componentes

Las proyecciones nacionales de población de la República Dominicana fueron elaboradas mediante el método de los componentes demográficos por cohorte (MCDC), considerado el procedimiento estándar recomendado por las Naciones Unidas para la elaboración de proyecciones oficiales de población.

Este método proyecta la población a partir de una población base desagregada por sexo y edad, incorporando de forma explícita el efecto de los tres componentes del cambio demográfico: la fecundidad, la mortalidad y la migración internacional. El procedimiento consiste en hacer avanzar cada cohorte de población a través del tiempo, aplicando sucesivamente las probabilidades de supervivencia derivadas de las tablas de mortalidad, estimando los nacimientos a partir de las tasas específicas de fecundidad de las mujeres en edades reproductivas e incorporando el saldo migratorio correspondiente a cada grupo de edad y sexo.

En cada período de proyección, la población sobreviviente constituye la población inicial del período siguiente, a la cual se incorporan los nacimientos y los movimientos migratorios ocurridos durante el intervalo considerado. Este proceso iterativo garantiza la coherencia demográfica entre los distintos componentes y permite obtener estimaciones consistentes del tamaño y la estructura de la población para cada año del horizonte de proyección.

La principal ventaja del método de componentes por cohorte radica en que permite analizar de manera independiente el comportamiento de cada uno de los componentes demográficos y evaluar su incidencia sobre la evolución futura de la población, preservando la consistencia entre la fecundidad, la mortalidad, la migración y la estructura por sexo y edad.

Para la elaboración de las presentes estimaciones y proyecciones se construyó un único escenario oficial, sustentado en el análisis de las tendencias observadas y en supuestos demográficamente plausibles para cada uno de los componentes del cambio demográfico. Este escenario constituye la referencia oficial para la producción estadística, la planificación nacional y la formulación de políticas públicas.

3.3 Transición metodológica en las proyecciones de población: del enfoque 5x5 al 1x1

La transición del enfoque tradicional 5x5¹, basado en grupos quinquenales de edad y períodos de cinco años, hacia un marco 1x1, definido por edades simples y años individuales, constituye una actualización metodológica relevante para las estimaciones y proyecciones de población. Este cambio se alinea con las recomendaciones internacionales recientes y responde a la necesidad de producir información demográfica más detallada, transparente, replicable y útil para la planificación nacional.

En el caso de la República Dominicana, la adopción del enfoque 1x1 permite representar con mayor precisión la evolución anual de la fecundidad, la mortalidad y la migración internacional, así como sus efectos sobre la estructura por sexo y edad de la población. Al mismo tiempo, fortalece la capacidad del Sistema Estadístico Nacional para generar insumos consistentes con las demandas de indicadores demográficos anuales y con los requerimientos de seguimiento de políticas públicas.

Los principales aportes del enfoque 1x1 pueden resumirse en los siguientes aspectos:

- Mayor detalle analítico: La estimación por edad simple y año individual mejora el cálculo de indicadores específicos por cohorte y facilita el análisis de cambios demográficos ocurridos en años concretos.
- Mayor comparabilidad y oportunidad: El uso de series anuales facilita la comparación con censos, encuestas, registros administrativos y estimaciones nacionales e internacionales.
- Mayor transparencia metodológica: La documentación de datos, métodos y supuestos fortalece la replicabilidad del proceso y la confianza en los resultados oficiales.

La implementación del enfoque 1x1 requiere revisar la evidencia histórica disponible y adaptar la estimación de cada componente demográfico a una estructura anual por edad simple. En términos generales, el proceso considera:

- Fecundidad: Modelos que permitan desagregar las tasas de fecundidad por año individual, mejorando la precisión en la estimación de la descendencia esperada en cada cohorte.
- Mortalidad: Elaboración de tablas de vida completas para reflejar las variaciones anuales en la esperanza de vida y en las tasas de mortalidad por edad y sexo, y las consecuentes probabilidades de sobrevivencia.
- Migración: Adoptar nuevos enfoques para modelar el saldo migratorio internacional considerando datos de registros administrativos, censos y encuestas especiales.

Con estos insumos, el modelo estima y proyecta la población por sexo y edad mediante la ecuación compensadora, incorporando la acción conjunta de la fecundidad, la mortalidad y la migración internacional para cada período anual. A continuación se presenta la expresión de la ecuación compensadora:

$$N^{t+1} = N^t + B^{t,t+1} - D^{t,t+1} + I^{t,t+1} - E^{t,t+1}$$

1 Para más detalles metodológicos consultar: <https://www.one.gob.do/media/kz3pziw1/documento-metodol%C3%B3gico-elaboraci%C3%B3n-de-las-estimaciones-y-proyecciones-nacionales-de-poblaci%C3%B3n.pdf>

donde:

N^{t+1} = la población estimada en el año $t+1$ (1 de enero);

N^t = la población inicial estimada en el año t (1 de enero);

$B^{t,t+1}$ = los nacimientos de mujeres en edad fértil, ocurridos en el año t ;

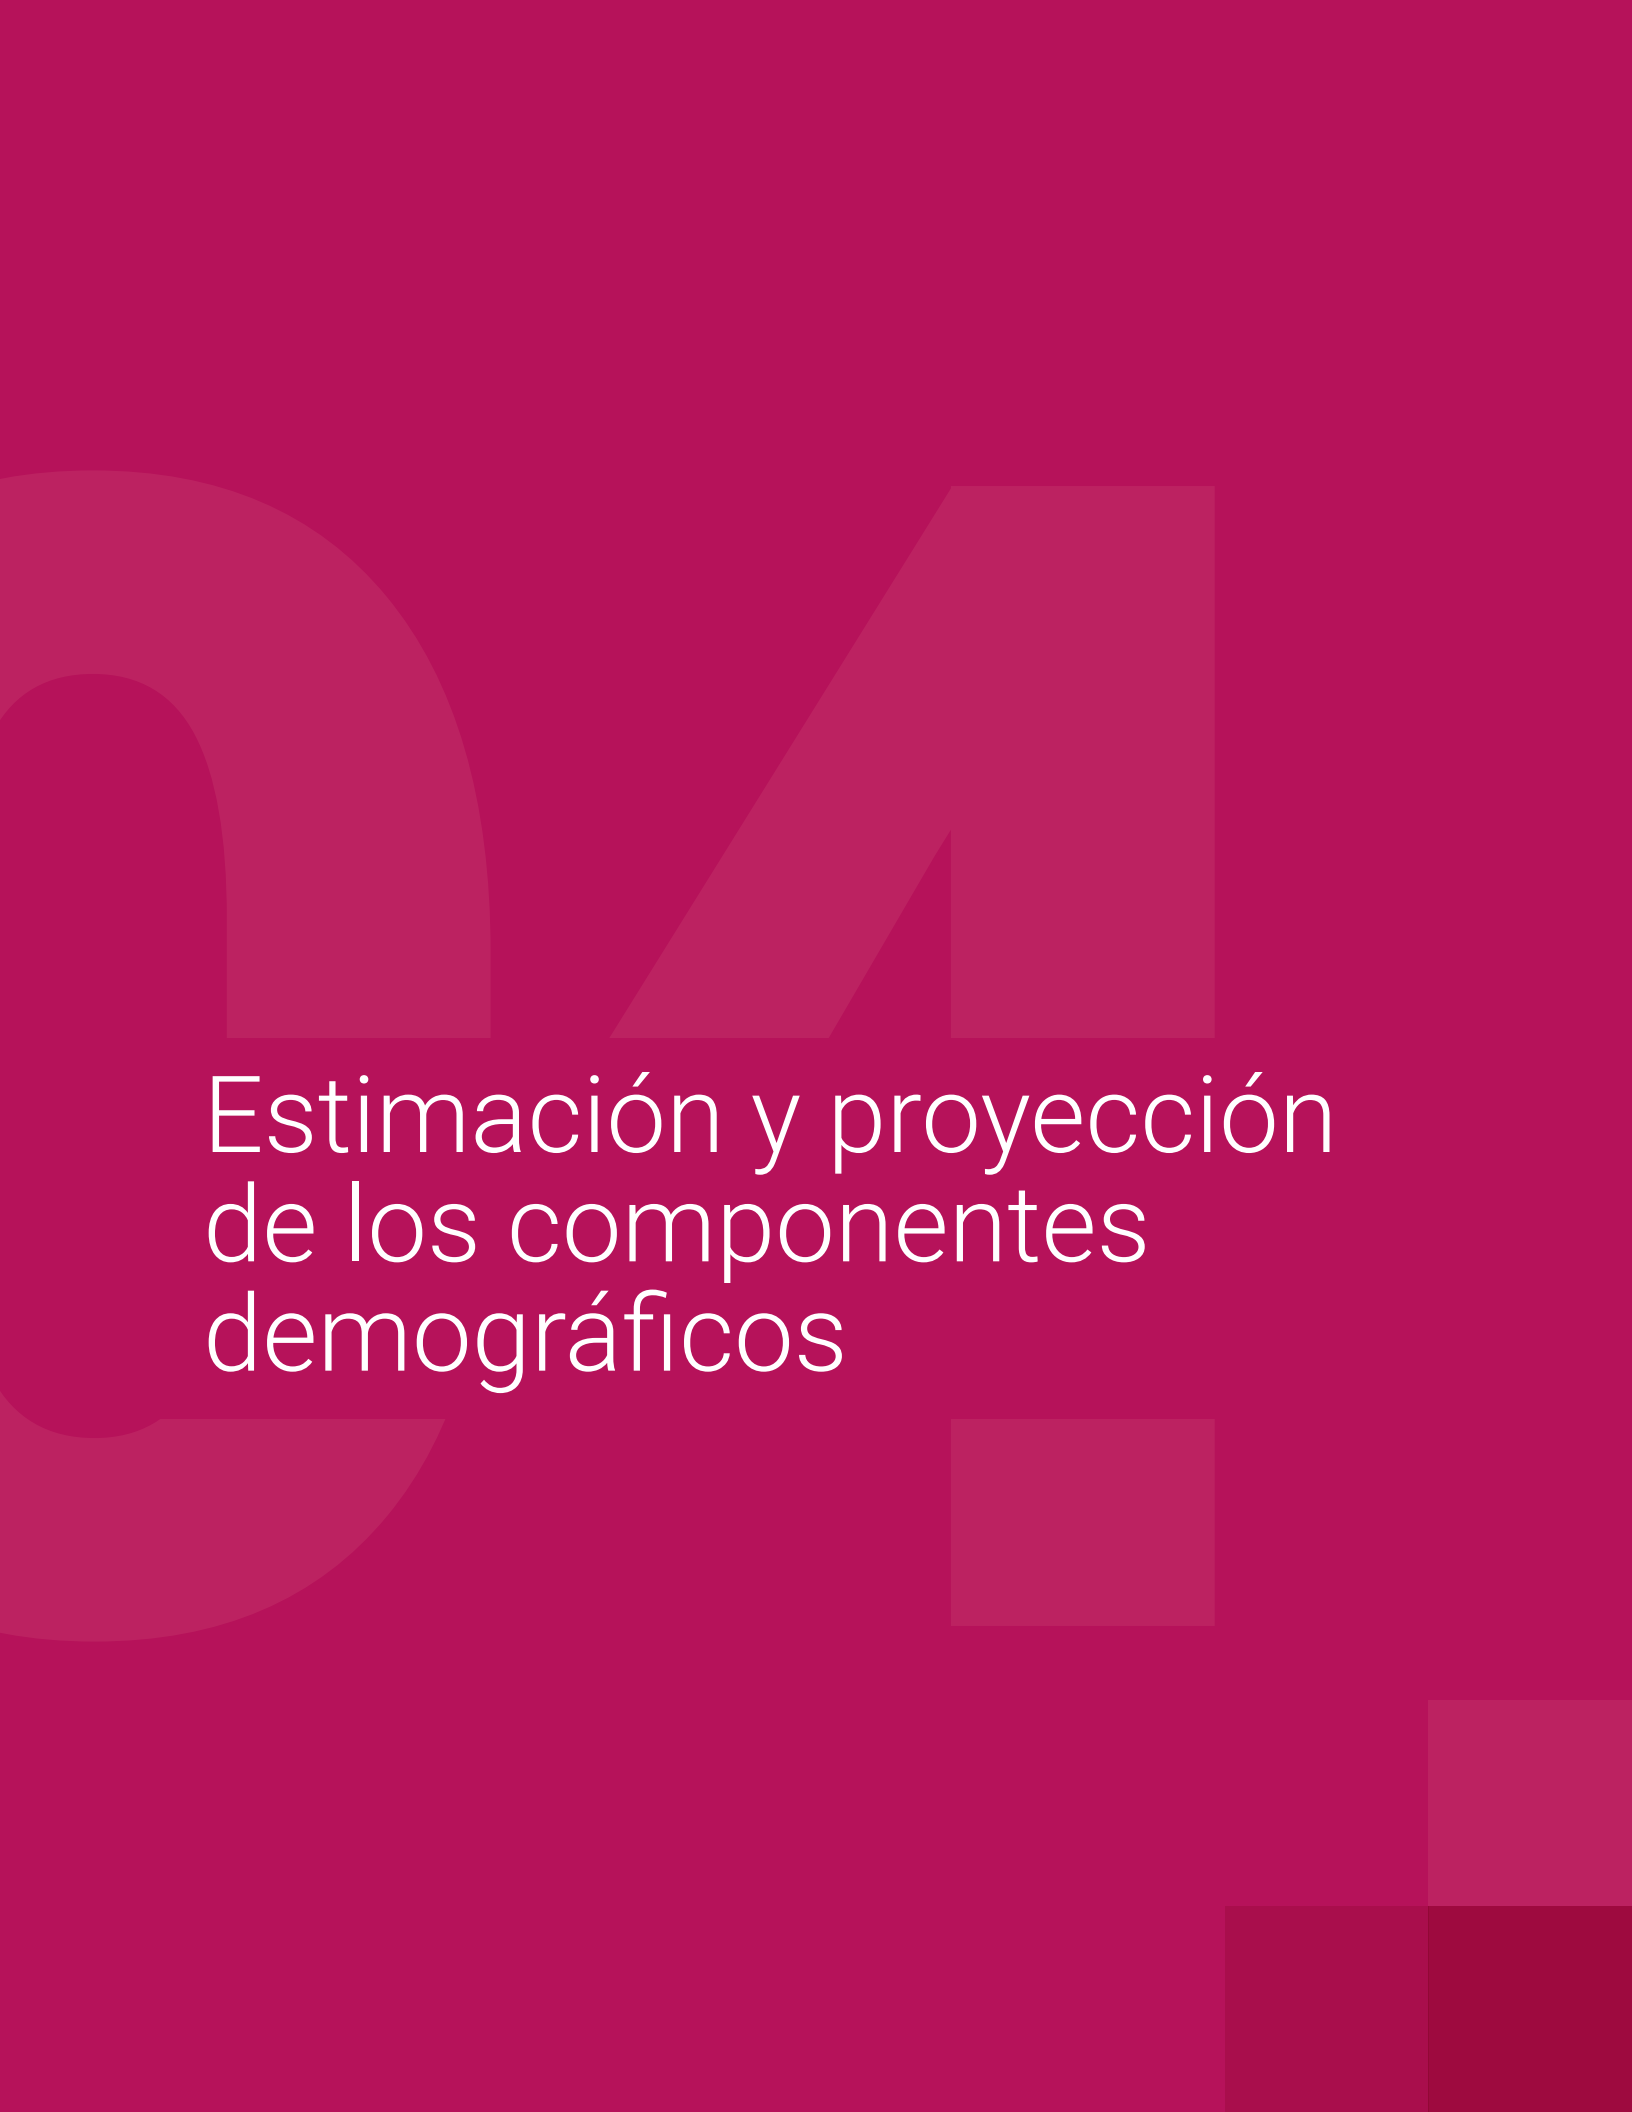

$D^{t,t+1}$ = las defunciones ocurridas en el año t ;

$I^{t,t+1}$ y $E^{t,t+1}$ = el total de inmigrantes y de los emigrantes en el año t .

No obstante, el enfoque 1x1 también exige condiciones técnicas e institucionales más robustas. Sus principales desafíos son:

- Mayor demanda de información básica: Se requiere un volumen más amplio de datos detallados sobre nacimientos, defunciones y migración, lo que puede ser un reto en contextos donde los registros administrativos son incompletos o desactualizados.
- Mayor inversión en análisis y verificación de consistencia: La estimación por años individuales de edad requiere procesos más detallados de revisión, conciliación y validación de datos provenientes de diversas fuentes, lo que implica una mayor demanda de tiempo, recursos técnicos y humanos para garantizar la calidad y coherencia de las estimaciones poblacionales.
- Mayor aplicación de metodologías y análisis demográficos: El paso de estimaciones quinquenales a anuales exige adaptar y fortalecer los métodos demográficos, evaluando su adecuación según la calidad de los datos disponibles y el contexto nacional. Esto incluye ajustar series históricas y aplicar técnicas más especializadas para lograr resultados comparables y útiles para la planificación pública.

En consecuencia, la transición al enfoque 1x1 debe acompañarse de mejoras continuas en la calidad, cobertura y oportunidad de las fuentes demográficas, así como del fortalecimiento de las capacidades técnicas responsables de producir y actualizar las estimaciones y proyecciones nacionales de población.

Estimación y proyección de los componentes demográficos

4. Estimación y proyección de los componentes demográficos

4.1 Fecundidad

Las estimaciones derivadas de las distintas fuentes y métodos fueron sometidas a un proceso de evaluación y conciliación técnica con el propósito de construir una serie histórica única y metodológicamente consistente de la fecundidad para el período 1950–2022. En este proceso se consideraron la calidad de la información disponible, la consistencia temporal de las series, la coherencia entre las tasas globales y las tasas específicas por edad, así como su compatibilidad con la evolución observada de la mortalidad, la migración y el crecimiento de la población. Como resultado, las tasas adoptadas representan una reconstrucción demográficamente consistente de la evolución de la fecundidad en la República Dominicana y no necesariamente los valores observados en una fuente específica, sino la síntesis técnica derivada de la integración y evaluación conjunta de toda la evidencia disponible. Este procedimiento responde a la práctica internacional utilizada en la elaboración de estimaciones y proyecciones demográficas, cuyo propósito es generar series históricas coherentes y comparables que aseguren la consistencia entre los distintos componentes de la dinámica demográfica.

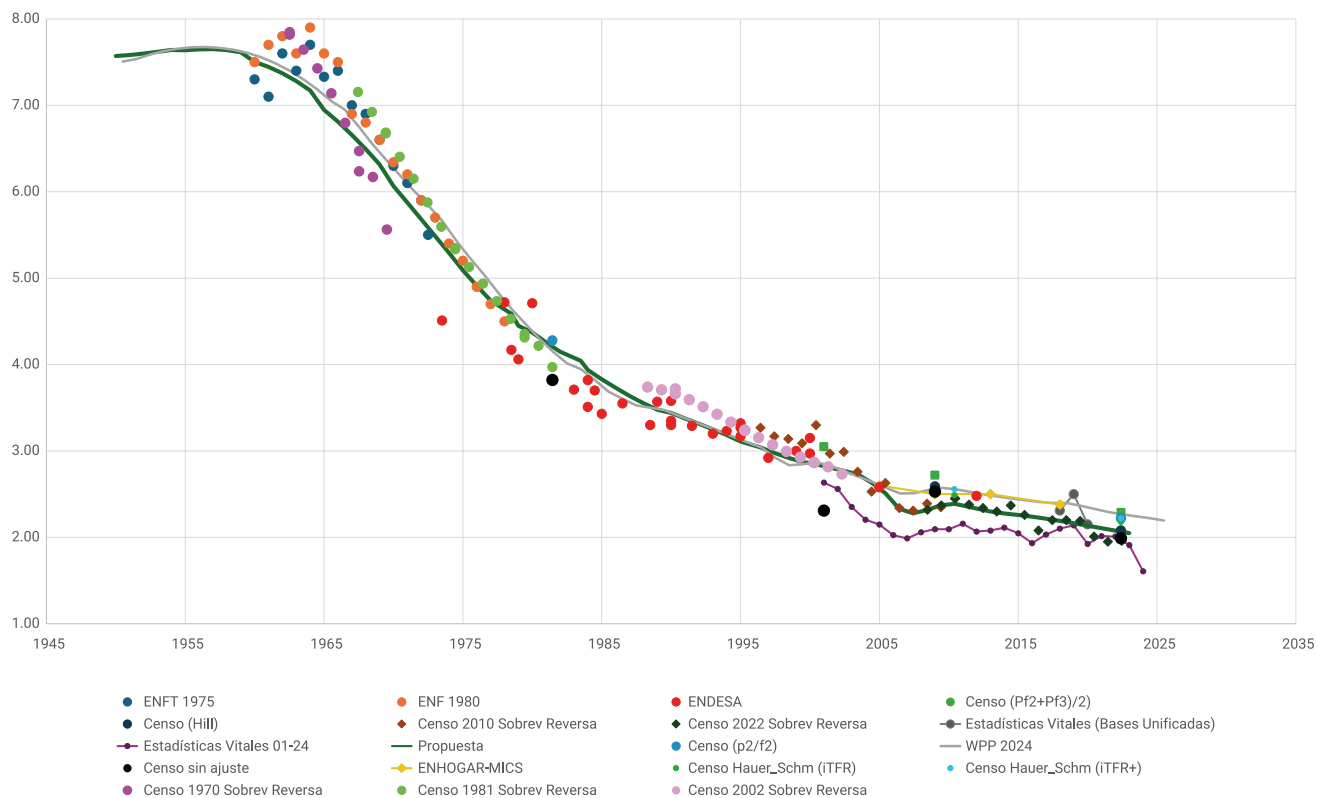

Las estimaciones obtenidas muestran que la República Dominicana experimentó una profunda transformación en su comportamiento reproductivo. La tasa global de fecundidad descendió desde niveles cercanos a siete hijos por mujer a comienzos de la década de 1950 hasta valores próximos a dos hijos por mujer en los años recientes, reflejando el avance sostenido de la transición de la fecundidad. Esta evolución estuvo asociada a importantes cambios sociales, económicos y culturales, entre ellos la expansión de la educación, el proceso de urbanización, el incremento de la participación de las mujeres en el mercado laboral, la difusión de los métodos anticonceptivos y la transformación de las preferencias reproductivas de las familias.

La incorporación de nuevos procesos de evaluación y conciliación demográfica permitió identificar una reducción temporal de la tasa de fecundidad ocurrida poco antes de mediados de la década de 2000, seguida de una recuperación hacia finales de ese mismo período, cuando los niveles retornaron a valores próximos a los registrados previamente. Aunque se trató de un descenso transitorio, este comportamiento deja una huella en la estructura de la población, debido a que el menor número de nacimientos ocurrido durante esos años dio lugar a una cohorte de menor tamaño. Esta diferencia se hace visible posteriormente en la estructura por edades como un pequeño hueco o estrechamiento que, con el paso del tiempo, se desplaza hacia edades superiores. De esta manera, una variación temporal de la fecundidad puede permanecer reflejada durante décadas en la estructura demográfica de la población.

Junto con la reducción del número promedio de hijos por mujer, también se modificó el patrón por edad de la fecundidad. A lo largo del período analizado se observa una mayor concentración de los nacimientos en las edades jóvenes del período reproductivo, alcanzando su máxima intensidad entre las mujeres de 20 a 24 años. Asimismo, en las décadas más recientes se evidencia un desplazamiento gradual del calendario reproductivo hacia edades ligeramente más avanzadas, consistente con el avance de la transición demográfica. La evolución de este patrón constituye un aspecto de particular importancia para las proyecciones demográficas, ya que la distribución de la fecundidad por edad es un insumo esencial del método de los componentes por cohorte empleado para proyectar la población.

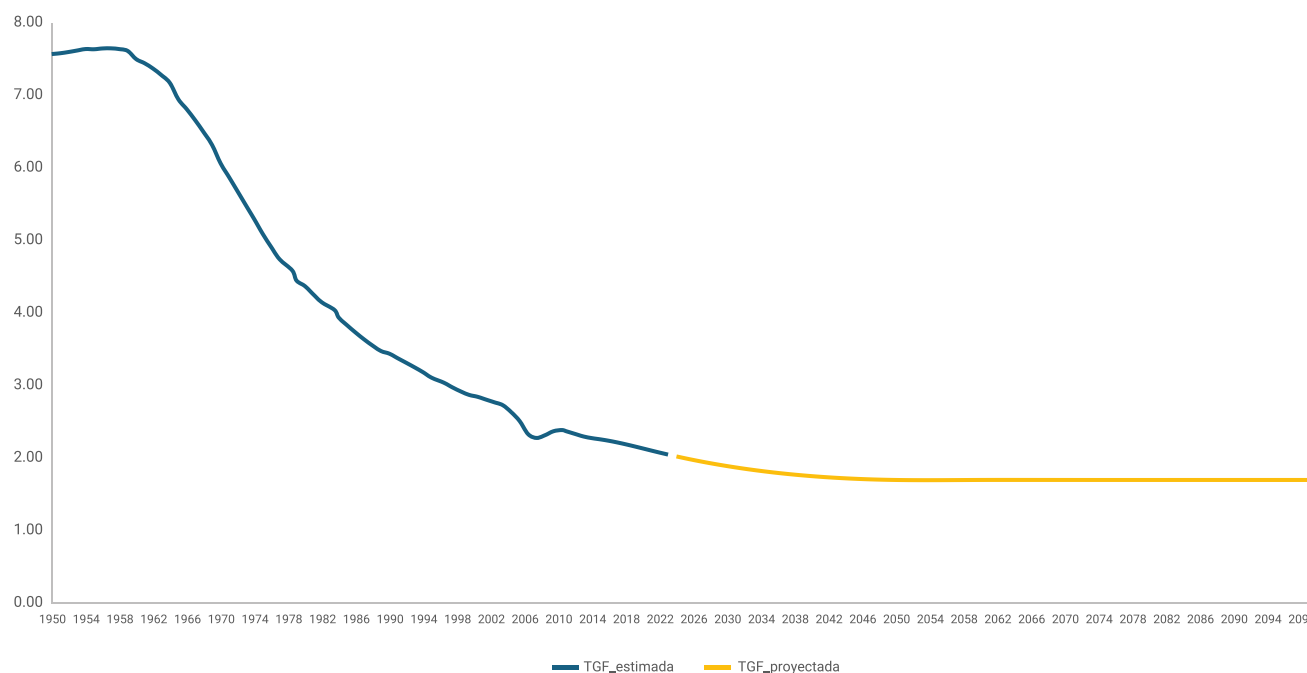

Las tasas globales de fecundidad y las correspondientes tasas específicas por edad obtenidas para cada año del período histórico constituyen la base para la formulación de las hipótesis de evolución futura de la fecundidad y para la elaboración de las proyecciones nacionales de población con horizonte al año 2100.

Gráfico 1. REPÚBLICA DOMINICANA: Tasa Global de Fecundidad, según fuentes de datos 1950-2022

Una vez definida la serie histórica de la tasa global de fecundidad (TGF) para el período 1950–2022, se procedió a proyectar su evolución para el período 2023–2100 mediante una función logística, modelo ampliamente utilizado en demografía para representar procesos de transición caracterizados por un descenso inicialmente acelerado y una desaceleración progresiva a medida que la fecundidad converge hacia un nivel de equilibrio de largo plazo.

La utilización de una función logística responde al comportamiento observado en la transición de la fecundidad, cuya evolución generalmente no sigue una trayectoria lineal. En las etapas iniciales de la transición, el descenso suele producirse con mayor intensidad, mientras que posteriormente tiende a desacelerarse hasta estabilizarse en niveles cercanos al reemplazo generacional o ligeramente inferiores. La función logística reproduce adecuadamente esta dinámica al generar una trayectoria continua, suave y demográficamente consistente, evitando variaciones abruptas o tendencias poco plausibles en el largo plazo. Los parámetros del modelo se estimaron a partir de la evolución histórica de la fecundidad, considerando la velocidad del descenso observada en las últimas décadas y el nivel de fecundidad asumido como asíntota para el horizonte de la proyección.

Gráfico 2. REPÚBLICA DOMINICANA: Tasa Global de Fecundidad estimadas y proyectadas 1950-2100

Sin embargo, la proyección del nivel de la fecundidad, expresado mediante la tasa global de fecundidad (TGF), no es suficiente para la aplicación del método de los componentes por cohorte. Este método requiere disponer, para cada año del período de proyección, de las correspondientes tasas específicas de fecundidad por edad, ya que estas determinan la distribución de los nacimientos entre las mujeres en edad reproductiva según su estructura por edad.

Con este fin, además de proyectar la TGF, se proyectó la estructura por edad de la fecundidad. Para ello se realizó una interpolación gradual de las tasas específicas de fecundidad entre los patrones observados durante el período histórico (1950–2022) y la estructura correspondiente al Modelo Oeste 14 de las Tablas Modelo de Fecundidad de las Naciones Unidas. La selección de este modelo respondió a que representa un patrón característico de poblaciones con niveles bajos o moderados de fecundidad y una distribución por edad compatible con etapas avanzadas de la transición demográfica. Asimismo, constituye una referencia ampliamente utilizada en la práctica demográfica internacional para proyectar la evolución del calendario reproductivo hacia estructuras más estables.

Este procedimiento permitió generar una transición gradual entre la estructura observada y la estructura objetivo, evitando cambios abruptos en la distribución de la fecundidad por edad y preservando la continuidad del patrón reproductivo a lo largo del horizonte de proyección.

Para cada año del período 2023–2100, la estructura relativa de la fecundidad obtenida mediante la interpolación se combinó con la TGF proyectada mediante la función logística. A partir de esta combinación se derivaron las correspondientes tasas específicas de fecundidad por edad, las cuales constituyen los parámetros utilizados para estimar el número anual de nacimientos dentro del método de los componentes por cohorte aplicado en las proyecciones nacionales de población.

De esta forma, se garantiza la coherencia entre el nivel y la estructura de la fecundidad proyectada, asegurando que la evolución futura de los nacimientos refleje simultáneamente la disminución prevista de la fecundidad y la evolución esperada del calendario reproductivo de las mujeres.

Los Gráficos 3 y 4 presentan la evolución de las tasas específicas y de la estructura por edad de la fecundidad estimadas y proyectadas para el período 1950–2100. Los resultados muestran un descenso sostenido de la fecundidad desde las décadas de 1960 y 1970, que redujo el nivel reproductivo del país en aproximadamente dos tercios respecto al registrado a comienzos

de la década de 1950. Asimismo, evidencian una transformación gradual del calendario reproductivo, cuya evolución continúa durante el período de proyección, aunque a un ritmo cada vez más moderado y convergente hacia una estructura compatible con niveles bajos de fecundidad.

4.2 Mortalidad

4.2.1 Niveles y tendencias de la mortalidad

Definir la tendencia y condición de la mortalidad de la población, en términos de su impacto, por sexo y la edad, es uno de los aspectos fundamentales que se abordan desde el campo del análisis demográfico, para caracterizar y producir las mejores estimaciones sobre la mortalidad, conocimiento que resulta básico entre otras cosas para la construcción de las tablas de vida o tablas de mortalidad.

La complejidad y dificultad en este campo se deriva, por una parte, del hecho que las condiciones de mortalidad están asociadas a múltiples factores de carácter biológico, económico, social, cultural e incluso político que son marco de referencia en estudios en profundidad de esta materia y de desde el punto de vista de su análisis, por los problemas en el Sistema de Estadísticas Vitales que presenta muchas deficiencias en términos de cobertura, calidad y oportunidad de los datos.

Las tablas de vida o tablas de mortalidad son el mejor instrumento para analizar la incidencia de la mortalidad, en términos del sexo y la edad, en virtud de que dicho modelo permite establecer las probabilidades de vida y de muerte de una población en función y a lo largo de su ciclo de vida. Con dichos modelos se logra describir el comportamiento de la mortalidad del pasado y del presente; además, mediante una proyección se logran vislumbrar las perspectivas de cambio futuro que se esperaría para las condiciones de mortalidad de la población.

Como se describió en el Capítulo 2, la estimación de la mortalidad se sustentó en la integración de diversas fuentes de información demográfica, principalmente los censos nacionales de población y vivienda, las estadísticas vitales y las encuestas demográficas. Sobre esta base se realizaron los procedimientos de evaluación y ajuste necesarios para garantizar la consistencia de las estimaciones por sexo y edad.

Para su construcción se utilizaron las tasas específicas de mortalidad por grupos de edad, calculadas a partir de las defunciones registradas y promediadas para períodos de tres o cinco años centrados en las fechas censales. Este procedimiento permite reducir los efectos de la variabilidad anual de la mortalidad, así como minimizar el impacto del subregistro de las defunciones en el Sistema de Estadísticas Vitales. Asimismo, se aplicaron métodos demográficos indirectos, entre ellos los desarrollados por Brass y Preston, para evaluar la cobertura de las estadísticas vitales y realizar los ajustes necesarios que garantizaran la consistencia de las estimaciones.

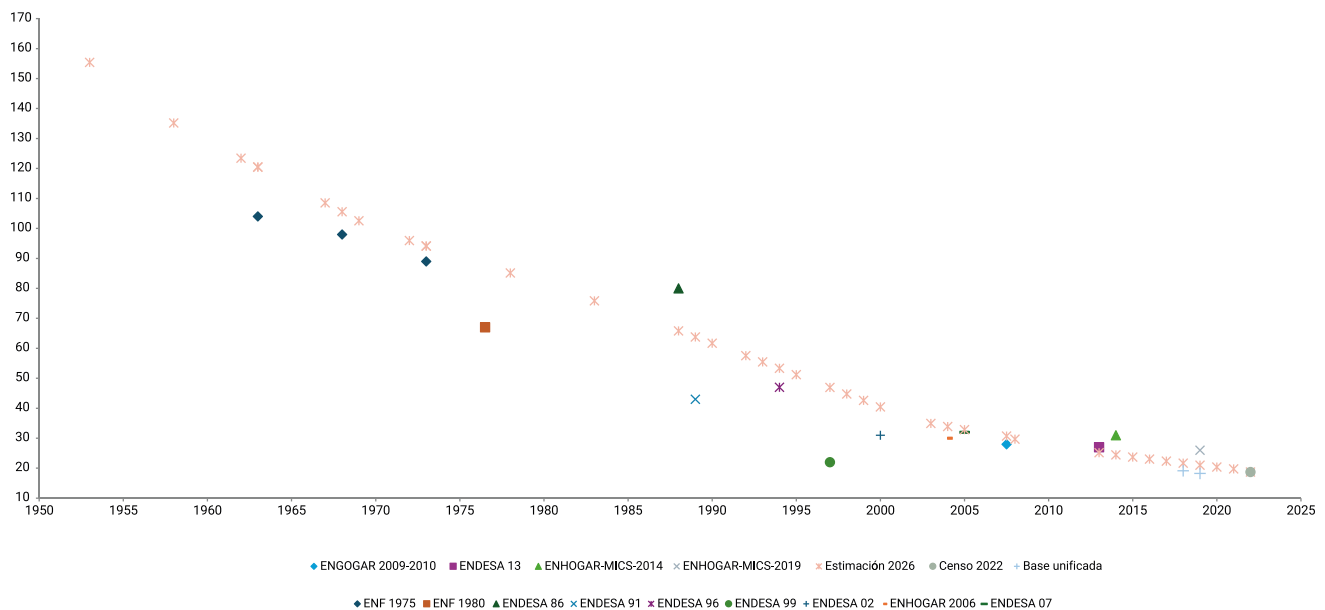

De esta manera se logró la construcción de una serie histórica de tablas de mortalidad para cada uno de los sexos en los diversos momentos censales, de donde se derivan las funciones (Relaciones de sobrevivencia $P(x, x+1)$), indispensables para la elaboración de las proyecciones de población, por sexo y grupos de edades.

Un indicador resumen derivado de las tablas de vida, importante y ampliamente utilizado, para visualizar los cambios en las condiciones de mortalidad de la población, este propósito, es la Esperanza de Vida al Nacer e_0 , indicador no afectado por la estructura por edad de la población. Este indicador, como medida resumen de la mortalidad por edad, hace referencia al número medio de años de vida que podrían llegar a vivir un grupo de recién nacidos si estuvieran expuestos a lo largo de su vida a los mismos riesgos de muerte que predominan en la población en el periodo de tiempo, al cual se refiere la tabla de mortalidad.

4.2.2 Mortalidad infantil

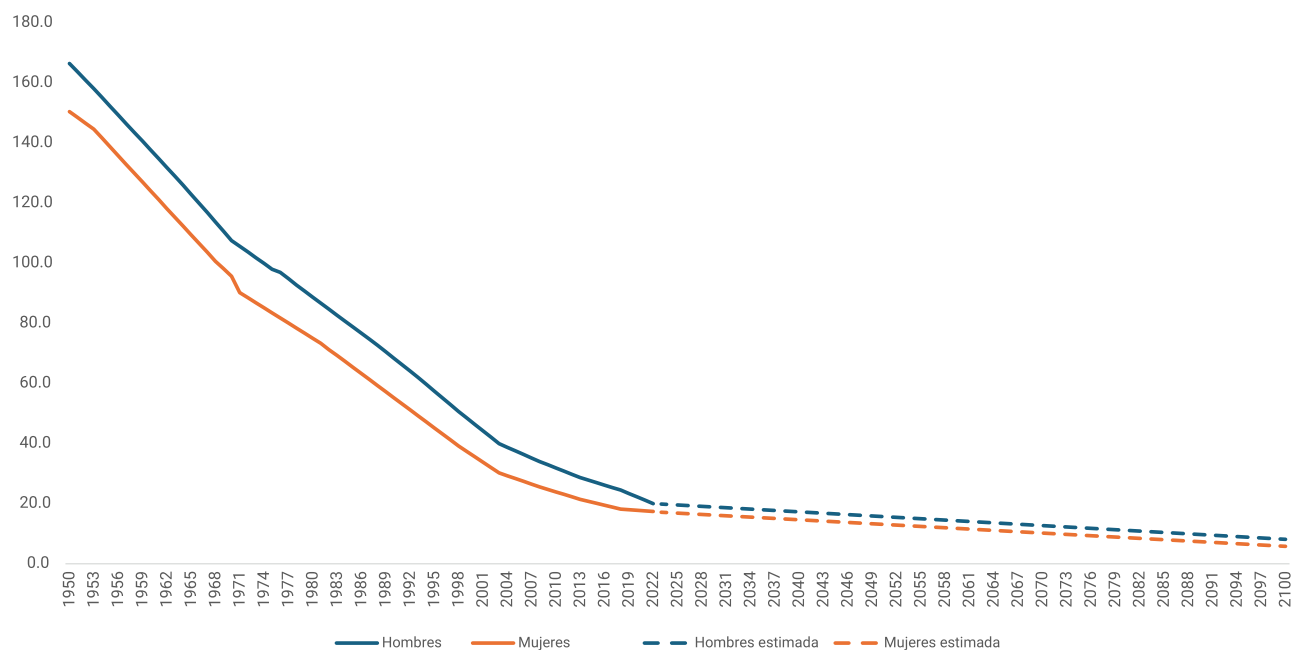

Definir la tendencia y condición de la mortalidad de la población, en términos de su impacto, por sexo y la edad, es uno de los aspectos fundamentales que se abordan desde el campo del análisis demográfico, para caracterizar y producir las mejores estimaciones sobre la mortalidad, conocimiento que resulta básico entre otras cosas para la construcción de las tablas de vida o tablas de mortalidad.

Gráfico 5. REPÚBLICA DOMINICANA: Niveles y tendencias de la mortalidad infantil, según diversas fuentes 1950-2022

Los resultados evidencian una reducción sostenida de la mortalidad infantil, expresión del fortalecimiento de la supervivencia infantil y de las transformaciones sanitarias, sociales y demográficas experimentadas por el país durante el período analizado.

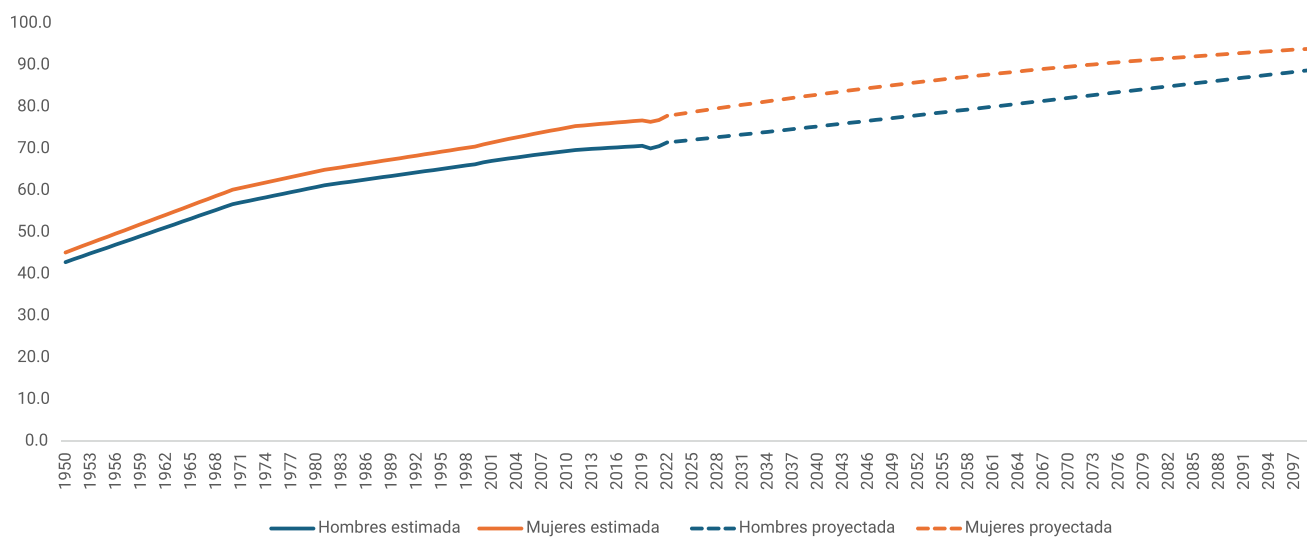

Gráfico 6. REPÚBLICA DOMINICANA: Mortalidad infantil estimada y proyectada, 1950-2100

4.2.3 Esperanza de vida al nacer

La esperanza de vida al nacer se utilizó como indicador sintético del nivel general de la mortalidad. Su evolución resume los cambios observados en la supervivencia de la población y constituye uno de los principales parámetros empleados en la construcción² de las tablas de mortalidad y en la formulación de las hipótesis utilizadas para las proyecciones nacionales de población.

Gráfico 7. REPÚBLICA DOMINICANA: Esperanza de vida estimada y proyectada por sexo, 1950-2100

4.2.4 Tablas de mortalidad del período histórico, 1950–2022

La descripción detallada de los procedimientos, supuestos y métodos utilizados para la elaboración de las tablas de mortalidad se presenta en el documento metodológico específico **"Tablas de Mortalidad de la República Dominicana, 1950–2100"**. En esta publicación se incluye únicamente una síntesis de los principales procedimientos aplicados, con el propósito de facilitar la comprensión de la metodología utilizada en las estimaciones y proyecciones nacionales de población.

Las tablas de mortalidad correspondientes a los años censales constituyeron la base para la reconstrucción histórica de la mortalidad. Debido a que originalmente estaban disponibles como tablas abreviadas por grupos quinquenales de edad y con un grupo abierto de 80 años y más, fue necesario adaptarlas a los requerimientos del método de los componentes por cohorte, transformándolas en tablas completas por edades simples y extendiéndolas hasta un grupo abierto de 100 años y más.

La conversión de las tablas abreviadas se realizó mediante la aplicación de diferentes procedimientos demográficos según el comportamiento de la mortalidad en cada tramo de edad. Las edades comprendidas entre 5 y 79 años fueron desagregadas mediante operadores de Beers; las edades de 1 a 4 años utilizando los coeficientes de Coale y Demeny; mientras que el primer año de vida fue tratado mediante factores de separación específicos para la mortalidad infantil. En las edades avanzadas, las tablas fueron prolongadas hasta 100 años y más utilizando el modelo logístico de Kannisto para ajustar las tasas centrales de mortalidad a partir de los 95 años, asegurando una transición consistente con las edades precedentes. Posteriormente, las tablas obtenidas fueron sometidas a procedimientos de validación para verificar la coherencia de sus funciones biométricas y de la esperanza de vida al nacer.

Una vez construidas las tablas completas correspondientes a los años censales, se generaron las tablas para los años intermedios mediante interpolación lineal de las probabilidades de morir (q_x), los factores de separación utilizados en las primeras edades y la esperanza de vida correspondiente al grupo abierto de 100 años y más, obteniéndose una serie anual

² Los procedimientos técnicos empleados para la elaboración de las tablas de mortalidad se encuentran documentados de manera exhaustiva en un informe metodológico independiente. En este documento se presenta únicamente una síntesis de los aspectos metodológicos esenciales para comprender el proceso de estimación y proyección de la mortalidad utilizado en las proyecciones nacionales de población.

continúa de tablas de mortalidad para el período histórico. Para el período proyectado, la interpolación se realizó entre la tabla observada correspondiente a 2022 y una tabla límite de referencia con una esperanza de vida al nacer de 100 años para ambos sexos, representando una evolución gradual de la mortalidad compatible con los supuestos adoptados para las proyecciones de largo plazo.

La construcción de las tablas estimadas y proyectadas integró estos procedimientos con la interpolación logística de la esperanza de vida al nacer mediante un proceso iterativo orientado a garantizar la coherencia entre las probabilidades de morir por edad y los niveles de esperanza de vida previstos para cada año. A través de ajustes sucesivos de las probabilidades de morir se logró preservar la consistencia interna de las tablas y el equilibrio biométrico de todas sus funciones.

Las tablas definitivas se elaboraron a partir de las probabilidades de morir ajustadas y de una cohorte hipotética de 100,000 nacidos vivos. Con estos insumos se calcularon las principales funciones de la tabla de vida, supervivientes (l_x), defunciones (dx), probabilidades de morir (q_x), probabilidades de sobrevivir (p_x), años-persona vividos (L_x), años por vivir (T_x) y esperanza de vida (e_x), obteniéndose tablas completas por edad simple y sexo para cada año del período 1950-2100.

Como producto complementario también se elaboraron tablas abreviadas por grupos quinquenales de edad y un grupo abierto de 100 años y más, facilitando su utilización en estudios demográficos, epidemiológicos, actuariales y en las estimaciones y proyecciones oficiales de población.

Gráfico 8. REPÚBLICA DOMINICANA: Probabilidad de morir por edad, según censo, hombres, 1950, 1970, 1981, 2002, 2010 y 2022

Gráfico 10. REPÚBLICA DOMINICANA: Sobremortalidad masculina por edad, según censo, 1950, 1970, 1981, 2002, 2010 y 2022

4.3 Migración internacional

La migración internacional es uno de los tres componentes fundamentales del cambio demográfico y, al mismo tiempo, el más complejo de estimar y proyectar. A diferencia de la fecundidad y la mortalidad, para las cuales existen registros continuos y metodologías consolidadas de medición, la migración no dispone de un sistema estadístico que permita observar directamente los movimientos de entrada y salida de la población de manera completa y permanente. En consecuencia, su estimación requiere la integración de diversas fuentes de información, como se mencionó el capítulo 2, y la aplicación de procedimientos demográficos indirectos que permitan reconstruir su comportamiento en el tiempo y garantizar la coherencia con la evolución de la población observada.

Históricamente, la República Dominicana se ha caracterizado por ser un país de emigración neta, condición que ha incidido de manera importante en la evolución de su población, los principales destinos de los emigrantes dominicanos han sido los Estados Unidos de América, Puerto Rico y, desde finales del siglo XX, España. Paralelamente, el país ha experimentado una inmigración sostenida, integrada principalmente por población nacida en Haití y, en años recientes, por inmigrantes procedentes de otros países, entre ellos Venezuela, los Estados Unidos y España, reflejando una mayor diversificación de los flujos migratorios internacionales.

Los resultados de los censos nacionales muestran una evolución importante del volumen de población nacida en el extranjero residente en el país. Mientras el Censo de 2002 registró 78,307 inmigrantes, de los cuales aproximadamente dos terceras partes correspondían a personas nacidas en Haití, el Censo de 2010 contabilizó 364,598 extranjeros, incrementándose también la participación relativa de la población haitiana. El Censo Nacional de Población y Vivienda de 2022 confirma la continuidad de este proceso y evidencia, además, un crecimiento de inmigrantes provenientes de otros países, configurando un panorama migratorio más diverso que el observado en décadas anteriores.

En sentido inverso, la emigración dominicana ha mantenido una tendencia creciente durante las últimas décadas. La información disponible en los censos de los principales países receptores, así como las estadísticas compiladas por el Programa IMILA y otras fuentes internacionales, evidencian un incremento sostenido del número de dominicanos residentes en el exterior, consolidando a la emigración como uno de los factores que más ha contribuido a modificar la dinámica demográfica nacional.

Considerando las limitaciones inherentes a las fuentes disponibles, la estimación del componente migratorio se realizó mediante un proceso de integración y conciliación de toda la información existente, utilizando como marco de referencia los resultados de los censos nacionales de 1950, 1970, 1981, 2002, 2010 y 2022. A partir de este proceso fue posible estimar los saldos migratorios netos para cada período intercensal, asegurando su consistencia con la evolución de la población total estimada y con los demás componentes del cambio demográfico.

La distribución de los saldos migratorios se realizó por sexo y edad, considerando la estructura observada en las distintas fuentes de información y los patrones demográficos característicos de la migración internacional. Los resultados muestran que la emigración ha afectado principalmente a la población en edades jóvenes y económicamente activas, con diferencias por sexo que han variado a lo largo del tiempo. En los primeros decenios predominó la emigración de la mujer, mientras que en los períodos más recientes la composición por sexo tiende a equilibrarse, reflejando cambios en las modalidades y características de los procesos migratorios.

La emigración de población en edades reproductivas tiene además importantes implicaciones indirectas sobre el crecimiento demográfico, al reducir el número potencial de nacimientos en el país. De igual manera, la inmigración modifica la estructura por edad y sexo de la población residente y contribuye a compensar parcialmente las pérdidas ocasionadas por la emigración, particularmente en determinados grupos de edad. Por estas razones, la migración constituye un componente esencial en la dinámica demográfica y debe analizarse juntamente con la fecundidad y la mortalidad dentro del proceso de estimación y proyección de la población.

Con base en los saldos migratorios estimados durante el proceso de conciliación demográfica, se elaboraron los supuestos de migración para las proyecciones nacionales de población. Estos supuestos consideran una evolución gradual de los flujos migratorios internacionales, asumiendo una reducción progresiva de la intensidad de la emigración neta y una mayor estabilidad en la composición por sexo y edad de los migrantes, en concordancia con el avance de la transición demográfica, las tendencias recientes observadas y la experiencia internacional de países con características demográficas similares.

Los saldos migratorios netos obtenidos constituyen el insumo utilizado en el método de los componentes para estimar y proyectar la población nacional entre 1950 y 2100. A partir de la tendencia histórica observada y de los resultados del proceso de conciliación demográfica, se formuló la hipótesis de evolución futura de los saldos migratorios a partir del año 2023, estableciendo que el saldo migratorio tenderá gradualmente a la estabilización durante el período proyectado. Bajo este supuesto, se prevé que dicho saldo pueda alcanzar un balance cero (0) alrededor del año 2050 y mantenerse en ese nivel hasta el final del horizonte de proyección, en 2100. Su incorporación garantiza la coherencia entre los tres componentes del crecimiento demográfico, fecundidad, mortalidad y migración, y permite representar de manera consistente la evolución histórica y futura de la población de la República Dominicana bajo los supuestos adoptados en las presentes estimaciones y proyecciones.

Población base y supuestos demográficos

5. Población base y supuestos demográficos

Toda proyección demográfica requiere definir una población inicial o población base, a partir de la cual se estima la evolución futura mediante la acción conjunta de la fecundidad, la mortalidad y la migración internacional. En este capítulo se precisa la población base adoptada para las presentes proyecciones y se resumen los supuestos demográficos que orientan el período prospectivo, evitando reiterar los procedimientos metodológicos desarrollados en los capítulos anteriores.

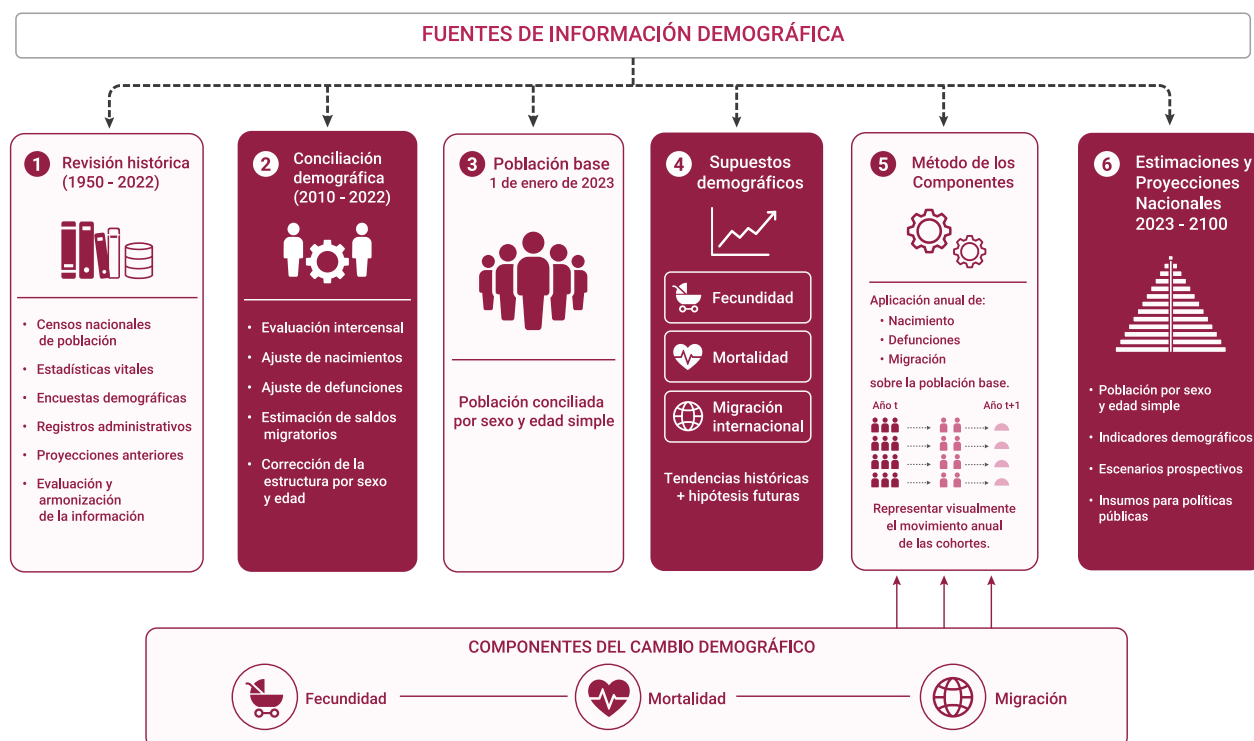

La población base fue definida a partir de la revisión y conciliación de la información demográfica disponible hasta el año 2022, con especial atención al X Censo Nacional de Población y Vivienda y a la evolución observada de los componentes del cambio poblacional durante el período intercensal 2010–2022.

La conciliación demográfica permitió ajustar el tamaño y la estructura por sexo y edad de la población censada, asegurando su coherencia con los nacimientos, defunciones y saldos migratorios estimados. De esta manera, la población inicial utilizada en la proyección no corresponde únicamente al dato censal observado, sino a una población técnicamente conciliada y compatible con la dinámica demográfica reciente del país.

Como resultado, la población base de las presentes proyecciones quedó establecida al 1 de enero de 2023. Esta población representa el mejor estimador disponible de la población residente al inicio del período de proyección y constituye el punto de partida para aplicar los supuestos de fecundidad, mortalidad y migración internacional definidos para el horizonte 2023–2100.

Las tablas completas de mortalidad obtenidas para el período 1950-2100 proporcionan una representación continua y consistente de la evolución de la supervivencia de la población dominicana, constituyendo un instrumento de referencia para el análisis demográfico, la investigación científica y la formulación de políticas públicas. Asimismo, fortalecen la producción de estadísticas oficiales al poner a disposición de las instituciones públicas, la academia, los organismos internacionales y demás usuarios especializados una base metodológica y empírica consistente para el estudio de la mortalidad y de la dinámica poblacional.

Diagrama 1. REPÚBLICA DOMINICANA: Proceso metodológico para la elaboración de las Estimaciones y Proyecciones Nacionales de Población, 1950-2100.

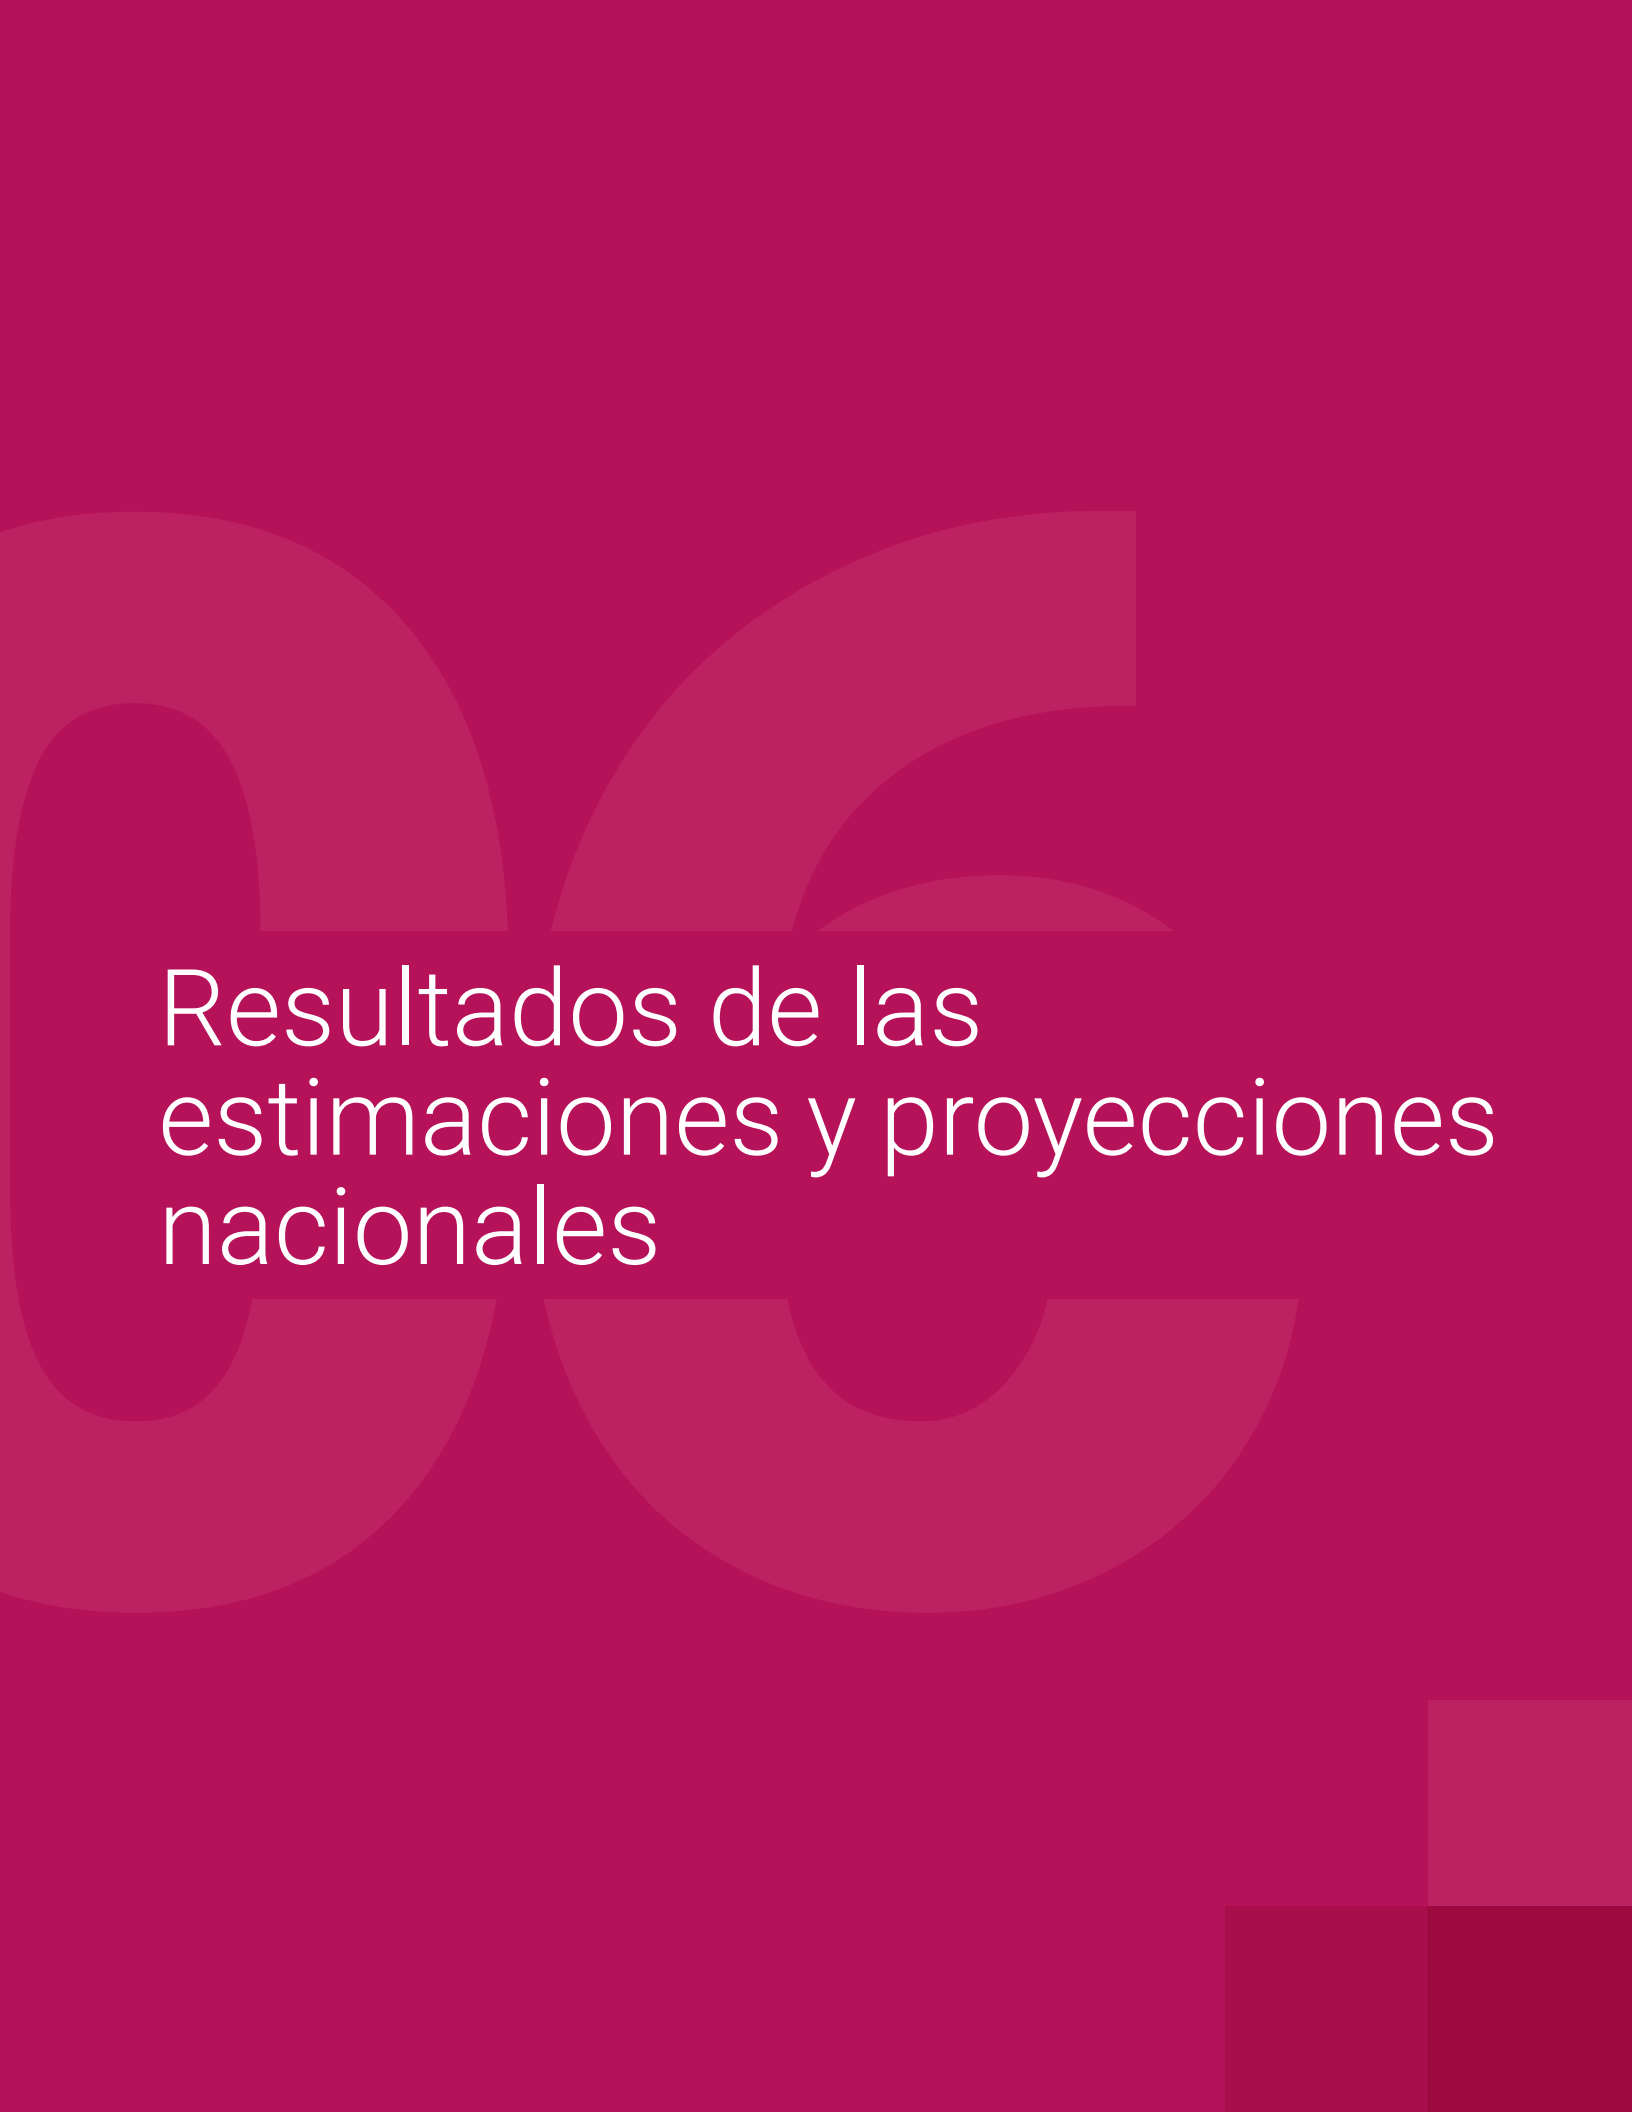

Aunque el período prospectivo se inicia en 2023, la serie histórica 1950–2022 se mantiene como marco de referencia para asegurar continuidad y comparabilidad entre las estimaciones históricas y las proyecciones futuras. Esta articulación permite interpretar los resultados proyectados como una prolongación coherente de la dinámica demográfica observada.

Los supuestos demográficos adoptados para la proyección se fundamentan en las tendencias históricas y recientes de los tres componentes del cambio poblacional. Su formulación busca representar trayectorias plausibles y consistentes con el avance de la transición demográfica en la República Dominicana.

En fecundidad, se asumió la continuidad del descenso gradual observado en las últimas décadas, acompañado de cambios en el calendario reproductivo. En mortalidad, se consideró la prolongación de las mejoras en la supervivencia, reflejadas en el aumento progresivo de la esperanza de vida al nacer y la reducción de las probabilidades de morir. En migración internacional, se adoptaron saldos compatibles con la evolución reciente de los flujos migratorios y con una tendencia de estabilización de largo plazo.

La aplicación conjunta de estos supuestos sobre la población base conciliada permite estimar anualmente el tamaño y la estructura por sexo y edad de la población. Los nacimientos incorporan nuevos efectivos poblacionales, las defunciones reducen la población sobreviviente y la migración modifica tanto el volumen como la composición de la población residente.

En síntesis, la población base conciliada al 1 de enero de 2023 y los supuestos adoptados para cada componente demográfico garantizan la coherencia interna de las estimaciones y proyecciones nacionales para el período 1950–2100. Este marco proporciona una base sólida para la planificación, la formulación de políticas públicas y el análisis prospectivo del desarrollo demográfico de la República Dominicana.

Resultados de las estimaciones y proyecciones nacionales

6. Resultados de las estimaciones y proyecciones nacionales

6.1 Estimaciones y proyecciones de población

Las estimaciones y proyecciones nacionales indican que la población de la República Dominicana mantendrá una trayectoria de crecimiento durante gran parte del siglo XXI, aunque a un ritmo progresivamente menor como resultado de la evolución de los componentes demográficos. La población pasa de 2.3 millones de habitantes en 1950 a 10.7 millones en 2022 y se proyecta que alcance aproximadamente 12.7 millones en 2100.

La evolución del crecimiento poblacional evidencia tres etapas claramente diferenciadas. La primera, comprendida entre 1950 y 1970, se caracteriza por tasas de crecimiento superiores al 3% anual, impulsadas por elevados niveles de fecundidad y el descenso sostenido de la mortalidad. Posteriormente, el crecimiento inicia una desaceleración gradual como consecuencia de la reducción de la fecundidad, alcanzando tasas cercanas al 1% anual hacia el período reciente.

Las proyecciones indican que esta tendencia continuará en las próximas décadas. Para 2026, la población nacional se estima en 11.1 millones de habitantes, con una tasa anual de crecimiento de 0.9%, lo que confirma la consolidación de un crecimiento demográfico moderado. A medida que avanza el siglo XXI, el incremento anual de la población continuará reduciéndose hasta aproximarse a valores cercanos a cero hacia 2070. Posteriormente, las proyecciones muestran el inicio de un proceso de disminución absoluta de la población, asociado principalmente a niveles persistentemente bajos de fecundidad y al incremento del peso relativo de las defunciones como consecuencia del envejecimiento demográfico.

La composición por sexo también experimenta una transformación gradual. Mientras en 1950 existían 102.6 hombres por cada 100 mujeres, el índice de masculinidad disminuye de manera sostenida hasta situarse en 95.1 hombres por cada 100 mujeres en 2100. Esta evolución refleja el efecto acumulado de la mayor supervivencia de las mujeres y la creciente concentración de la población en edades avanzadas, donde predominan las mujeres.

Cuadro 3. REPÚBLICA DOMINICANA: Población estimada y proyectada al 1 de enero de cada año, por sexo, índice de masculinidad y tasa de crecimiento anual, 1950- 2100, continuación...

Año	Total	Sexo		Índice de Masculinidad	Tasa anual de crecimiento
		Hombres	Mujeres		
2086	13,296,004	6,440,052	6,855,952	93.9	-0.2
2087	13,268,471	6,428,626	6,839,845	94.0	-0.2
2088	13,239,177	6,416,519	6,822,658	94.0	-0.2
2089	13,208,163	6,403,744	6,804,419	94.1	-0.2
2090	13,175,495	6,390,330	6,785,165	94.2	-0.2
2091	13,141,191	6,376,288	6,764,903	94.3	-0.3
2092	13,105,306	6,361,629	6,743,677	94.3	-0.3
2093	13,067,917	6,346,388	6,721,529	94.4	-0.3
2094	13,029,086	6,330,590	6,698,496	94.5	-0.3
2095	12,988,903	6,314,266	6,674,637	94.6	-0.3
2096	12,947,462	6,297,461	6,650,001	94.7	-0.3
2097	12,904,827	6,280,192	6,624,635	94.8	-0.3
2098	12,861,068	6,262,476	6,598,592	94.9	-0.3
2099	12,816,242	6,244,337	6,571,905	95.0	-0.3
2100	12,770,413	6,225,805	6,544,608	95.1	-0.4

Los resultados evidencian (ver cuadro 3) un cambio estructural en la dinámica poblacional, caracterizado por la desaceleración del crecimiento, la transformación de la composición por edad y el aumento progresivo del peso relativo de la población adulta y adulta mayor. Durante el período analizado, el crecimiento de la población deja de estar impulsado por elevados niveles de fecundidad y evoluciona hacia un escenario de crecimiento moderado que, en el largo plazo, tiende a estabilizarse e incluso a registrar tasas negativas. Esta trayectoria responde al comportamiento conjunto de los componentes demográficos y configura un nuevo contexto para la planificación del desarrollo.

Figura 2. REPÚBLICA DOMINICANA: Estructuras por sexo y edad de la población, estimados y proyectados por año, 1950, 1975, 2000, 2025, 2050, 2075 y 2100, continuación...

Las proyecciones muestran que los principales cambios demográficos del siglo XXI estarán asociados menos al aumento del volumen de la población que a su transformación estructural. El incremento de la longevidad, la reducción del peso relativo de la población infantil y el avance del envejecimiento modificarán las relaciones de dependencia, la estructura de los hogares y la demanda de servicios, con implicaciones directas para los sistemas de salud, los cuidados de larga duración, la protección social, el mercado laboral y el ordenamiento territorial.

En este contexto, las estimaciones y proyecciones de población constituyen un insumo estratégico para la formulación, implementación y evaluación de políticas públicas. Su utilización permite anticipar las transformaciones demográficas futuras, fortalecer la inteligencia demográfica del país y orientar la toma de decisiones basada en evidencia, favoreciendo una planificación con enfoque de resiliencia demográfica frente a los desafíos derivados del envejecimiento de la población y de los cambios en la estructura por edad.

Alcance, utilización y actualización de las estimaciones y proyecciones de población

7. Alcance, utilización y actualización de las estimaciones y proyecciones de población

Las estimaciones y proyecciones nacionales de población constituyen la base demográfica oficial para el análisis de la dinámica poblacional de la República Dominicana y para la elaboración de estadísticas e indicadores que requieren información por edad y sexo. Sus resultados sirven de insumo para la planificación sectorial y territorial, la formulación y evaluación de políticas públicas, la elaboración de escenarios prospectivos y el desarrollo de investigaciones demográficas, sociales, económicas y ambientales.

Los resultados obtenidos deben interpretarse en el contexto de los supuestos demográficos adoptados para la fecundidad, la mortalidad y la migración internacional. En consecuencia, las cifras proyectadas representan la evolución esperada de la población bajo dichas hipótesis y no constituyen predicciones exactas sobre el comportamiento futuro de la población. Cualquier modificación significativa en la evolución de estos componentes podrá afectar los niveles y la estructura proyectada de la población.

La precisión de las estimaciones y proyecciones depende de la calidad, cobertura y oportunidad de las fuentes de información disponibles, así como de la validez de los supuestos utilizados para describir la evolución futura de los componentes demográficos. Como se mencionó en el capítulo 2, las fuentes de información en las últimas décadas han mostrado mejoras significativas como por ejemplo las estadísticas vitales, los censos y encuestas, lo que contribuye a una mejor estimación de población. Entre ellos, la migración internacional continúa siendo el componente sujeto a mayor incertidumbre debido a su sensibilidad frente a cambios económicos, sociales, políticos, ambientales y geopolíticos. Asimismo, eventos extraordinarios, como pandemias, desastres naturales o crisis económicas, pueden modificar las tendencias demográficas previstas y hacer necesaria la revisión de las hipótesis inicialmente adoptadas.

Por esta razón, las estimaciones y proyecciones nacionales de población deben entenderse como un proceso dinámico y sujeto a actualización permanente. La incorporación de nuevos censos de población y vivienda, estadísticas vitales revisadas, registros administrativos fortalecidos y otras fuentes de información permitirá revisar periódicamente los niveles y tendencias de la fecundidad, la mortalidad y la migración, garantizando la consistencia y pertinencia de las futuras revisiones.

Las series de población estimadas y proyectadas presentadas en este documento constituyen el marco demográfico de referencia para la elaboración de estadísticas oficiales y para el desarrollo de estudios especializados. Su utilización deberá considerar el horizonte temporal de las proyecciones, las hipótesis adoptadas y las limitaciones inherentes a todo ejercicio prospectivo, de conformidad con las recomendaciones internacionales para la producción de estimaciones y proyecciones demográficas.

GLO SIA RIO

Glosario

Glosario

Año base	Año o fecha de referencia a partir de la cual se inicia la proyección de población.
Año calendario	Período comprendido entre el 1 de enero y el 31 de diciembre.
Análisis demográfico	Estudio de la estructura, distribución y dinámica de una población mediante el análisis de sus componentes y características.
Cambio demográfico	Variación del tamaño y la estructura de una población como resultado de la fecundidad, la mortalidad y la migración.
Cohorte	Conjunto de personas que experimentan un mismo evento durante un período determinado, generalmente el nacimiento.
Coeficiente de supervivencia	Proporción de personas que sobreviven de una edad a la siguiente según una tabla de mortalidad.
Conciliación demográfica	Proceso mediante el cual se armonizan censos, estadísticas vitales y migración para obtener estimaciones consistentes de la población.
Crecimiento natural	Diferencia entre nacimientos y defunciones.
Crecimiento total	Resultado conjunto del crecimiento natural y la migración neta.
Defunción	Desaparición permanente de todo signo de vida después del nacimiento.
Dinámica demográfica	Conjunto de cambios que experimenta una población como consecuencia de la fecundidad, mortalidad y migración.
Edad exacta	Edad cumplida de una persona expresada en años completos.
Edad simple	Edad expresada año por año (0, 1, 2... 100 años y más).
Emigración	Salida de personas para establecer su residencia habitual en otro país.
Esperanza de vida al nacer	Número promedio de años que se espera viva una persona recién nacida bajo las condiciones de mortalidad vigentes.
Estimación de población	Cálculo del tamaño y estructura de la población correspondiente a un momento determinado.
Fecha de referencia	Momento específico al que corresponden las estimaciones o proyecciones.
Fecundidad	Componente demográfico relacionado con la ocurrencia de nacimientos.
Grupo abierto de edad	Último grupo de una distribución por edades que comprende todas las edades iguales o superiores a un límite determinado (por ejemplo, 100 años y más).
Grupo quinquenal de edad	Agrupación de edades en intervalos de cinco años.
Indicadores demográficos	Medidas estadísticas que describen el comportamiento de los componentes demográficos.
Interpolación	Procedimiento matemático utilizado para estimar valores intermedios entre observaciones conocidas.
Interpolación de Beers	Método utilizado para transformar distribuciones quinquenales en distribuciones por edades simples.
Método de los componentes	Método de proyección que incorpora separadamente la fecundidad, la mortalidad y la migración.
Migración internacional	Movimiento de personas entre países con cambio de residencia habitual.
Migración neta	Diferencia entre inmigrantes y emigrantes.
Mortalidad	Componente demográfico relacionado con la ocurrencia de defunciones.
Pirámide de población	Representación gráfica de la estructura por sexo y edad de una población.
Población base	Población inicial utilizada para comenzar una proyección demográfica.

Población conciliada	Población ajustada mediante procedimientos de conciliación demográfica para asegurar consistencia entre censos y componentes demográficos.
Población residente	Conjunto de personas que residen habitualmente en un territorio.
Probabilidad de morir (qx)	Probabilidad de que una persona sobreviva hasta una edad determinada y fallezca antes de alcanzar la siguiente.
Proyección de población	Estimación del tamaño y estructura futura de una población bajo supuestos demográficos.
Saldo migratorio neto	Diferencia entre inmigración y emigración durante un período determinado.
Sexo	Característica biológica utilizada para clasificar la población en hombres y mujeres.
Supuestos demográficos	Hipótesis adoptadas sobre la evolución futura de la fecundidad, mortalidad y migración.
Tabla abreviada de mortalidad	Tabla construida utilizando grupos de edad, generalmente quinquenales.
Tabla completa de mortalidad	Tabla elaborada para cada edad simple.
Tasa bruta de mortalidad	Número de defunciones por cada mil habitantes durante un año.
Tasa global de fecundidad	Número promedio de hijos que tendría una mujer durante su vida reproductiva.
Transición demográfica	Proceso de cambio desde niveles elevados hacia niveles bajos de fecundidad y mortalidad.
Variable demográfica	Característica utilizada para describir el comportamiento de la población.
